All I can tell you is that I've run WinPSK, WinPSKse, DigiPan, Logger, Zanlanka, and the original PSKsb program without a problem on a number of straight Windows 98 machines.

My advice is to post your question on a real newsgroup - This one only seems inhabited by Trolls [most likely the same ones you might encounter on 20 meters and CB] - as you can see from the other response. I asked for help and only received smart mouthed responses as well.

And in fact it *is* illegal for many potential uses.

Perhaps you should try reading Part 97 more carefully, the sections
about permitted transmission.

>
> What? You guys are still having a deficit in the year 2000?

Hardly. Consider the liquidation value.

Those who quote silly numbers as above always forget the
other side of the balance sheet. He meant to say "debt" not
"deficit". A deficit means there is more debt than assets, and
that is simply not true. The US has a much larger balance
on the asset side of the balance sheet than it has on the debt
side of the balance sheet. There is no deficit, there is actually
a surplus. A very large surplus. But this discussion belongs in
a different newsgroup.

Want to buy Yellowstone? What would it bring at auction?
How about the Bonneville power system? The interstate freeways?

Another hint: where is the Social Security balance held?
Consider discounted current value of bonds.

What is meant by "... manufacturing more money ..."?

i.e. it's just another troll from a dead guy.

It is legal to provide a service to other hams, provided that you do not charge for the service, and that the messages contained comply with the FCC's rules. You (as sysop) are responsible to ensure conformity to FCC regulations. Private, personal E-mail is fine. But don't start sending advertizing, or soliciting for business transactions.

> > As long as you aren't conducting business over the Amateur

>
> Exactly.
>

This is true, and as a system operator, it is up to YOU to make sure it stays that way. Do you want to be responsible for filtering out all of the internet flotsam that may flow through your station? E-mail is one thing, but you open up a can of worms (and possible trouble with the FCC)if you start granting full internet access.

CQ Advice, CQ Advice DE AC7JO,

I am looking into packet but I don't know where to start. Could you point me to some web sites where I could start learning about how to get my feet wet? The TAPR web site is confusing and I have already read the ARRL TIS info on digital. Specifically, I am interested in TNCs and old PCs (I am Mac-only at present,) their prices, and availability's.
My eventual goal is to communicate with the International Space Station, and with my father, KD7GNO, when I go off to college. I own an IC-2100, and have been loaned an HF rig by WA9OXY. Also, I am a student whose parents have just bought a house, so I don't have much cash left. So, any advice? Thank you in advance for your time.

> http://pages.preferred.com/~piercej

Since the original post I've installed WinWarbler. This program runs fine.

There are a couple of problems here:

The concept of a "sound device programming API" is more a loose concept than a standard in the Microsoft world, as are most of the "APIs". In the Linux world the APIs are more strictly defined and adhered to.

Releasing source for Microsoft apps might help a bit, but will have nowhere near the impact of releasing source for Linux apps.

In the Linux world all the development tools are freely available and are provided with Linux. For Windows, you have to buy the development tools, often at hefty prices.

Since the authors of PSK programs are writting as a labor of love and not making a dime off their efforts, I can find no fault with them for not having a lab full of systems with every sound card on the market checking for compatibility with all of them.

On the original subject of what to do when things don't work, I would suggest the following:

First make sure the sound card works with Windows; i.e. can you hear the normal Windows sound effects?

Leave your speaker connected to the sound card and connect your receiver audio to the sound card. Can you hear the receiver audio through the sound card? You will probably have to play with the mixer settings to hear it. If you can't get audio out of the speaker, it is probably your wiring. If you can get audio but no waterfall, it is probably your PSK program; try another one.

Once you get receive to work, try transmitting with the speaker still attached to the sound card. You should hear the transmit audio.

If you are using serial port PTT, connect it up, turn the carrier and audio all the way down so you won't produce RF, and try transmitting. This should key the transmitter and verify the serial port is correctly configured and wired.

Remove the speaker, connect up the transmitter audio and try to transmit. If you can't get modulation, it is probably your wiring.

Hoffa misspoke - we have a National DEBT of 5 Trillion - and have
crushing interest payments. This year, we are running a small budget
surplus - but our politicians are trying to figure out ways to spend it.

>
> The topic was the regular handling of internet email via ham radio, to
> avoid the use of a common carrier internet connection.

The discussion is about PDAs Hank. Nobody is avoiding anything. The
common carriers do not provide equivalent services. There are MANY
cases where you can't use a common carrier, but could use your own
service in a PDA mobile application. I'm not about to carry around
BOTH, because I "might" be able to use the common carrier service
sometimes - that is silly.

The fact is - the big carriers are not going after this market because
they know it isn't worth investing R&D dollars on a service that it
will be archaic in a few years when TV Channel 60-60 are converted to
high-speed mobile digital access services.

There IS a small window of opportunity here. But guys like you are too
busy trying to treat digital data with kid gloves and "control freak"
ideas. Just treat digital data the same way you would treat voice
data. It is NO different. It is simply information.

Well the old Kantronics KPC-3's work fine but the new pluses are a
bit better. For packet any old 486 or low grade pentium will work just
fine for packet. You should be able to find used KPC-3's for a song,
old PCs as well. I use KAGold for packet, see:

http://www.interflex.com/

For more packet info check out:

http://www.ac6v.com/pagew.html#PACK

> think all those commercial radios are? You're talking out your ass.

I am really beginning to think that you cannot tell the difference
between commercial and Amateur. APRS is not a commercial venture. It is
a system that was put together by hams, for hams, and no one makes a
profit from it.

Commercial radios? What of it? How they are USED is what counts. Sure,
you can design a product and sell it to hams for use on the ham bands,
provided that using said product is not in violation of FCC rules. But
you cannot design a product that (for example) allows hams to
rebroadcast commercial radio and TV traffic over the ham frequencies, so
that they can hear it down at the lake, where reception is poor.

> patches! Quit talking out your ass.
>

Phone patches are legal PROVIDING that the traffic is not in contrary to FCC rules. For example, you cannot legally call your place or employment to conduct work related activities. You could not make sales calls over the autopatch either. Both of these are against the rules.

In the same vein, you can have packet radio, but the messages contained on it must be non-commercial, no advertizing, no spam (remember there is a no broadcast rule), nothing could transpire that could be interpreted as conducting business (Which means you cannot order some widget, pay your bills, sell amway, career E-bay'er etc) and the messages cannot be indecent, vulgar, obscene (so checking into your favorite nudie site is out).

Do you not yet see how hard it would be to allow direct connects to the internet backbone and filter out illegal content? Devices designed to filter on keywords, sites etc, can be gotten around very easily (ask any 12 yr old kid), so manual monitoring would still be required to keep the FCC happy.

But don't take my word for it. Send the FCC an E-Mail outlining your proposal, and see what THEY say. If you don't maybe I will.....

Heavens, if all you need is a terminal for a KPC-3, even an old 386 box is likely
to do the trick. Older machines are suitable, too, but the software support is likely
to be poor.

I beg to differ. My experience (as a developer of some Windows music
software) is that the sound API is quite stable and reliable on
Windows. My guess would be that any problems with particular sound
cards and particular programs are caused by bugs in the sound
card drivers, which are not rare enough.

Also, in my quite limited experience, Linux sound APIs are not
nearly so well defined. For one thing, there's too; the old
commercial OSS (Open [sic] Sound System), and ALSA (Advanced
Linux Sound Architecture, if I recall correctly).

ALSA is new and free. The linux kernel includes OSS/Free,
which is a cut down version of OSS/Linux, the commercial
product. The commercial product has lots more drivers.
Fine for 4Front-Tech (the authors) to make a few bucks,
but not in Linux's long term interests.

Well, that's better than here in Australia, where we have a large
surplus and our government refuses to spend it, despite the fact
that our petrol prices are out of control and most of that goes
in federal government taxes.

Wow, logged with point of origin! That will *scare* your abusers!
And what are you going to do when it turns out to be a dialup on uunet or
one of the other providers not interested in taking an abuse report??
Each time he dials in he will have another address, so there is little else
you can do than blocking the entire networks of those companies...

It is the same here... the surplus is used to pay back the national debt,
and the tax on petrol is built up in a very creative way: when the oil
prices drop, the government complains how the tax income drops because the
tax is a percentage, and they add a "temporary" fixed tax amount.
When the oil prices rise, they have completely forgotten about the
"temporary" fixed amount and let the percentage part do the job. We
already know what is going to happen when prices drop again...

And even with multiple different architectures, the writers of DSP
applications complain about lack of features and access the soundcard
directly, not via the drivers. So a card that works fine for generic Linux
sound may still fail when used for DSP modems.

I agree that in Windows the situation is better than in Linux.

An 8088 or a C-64 will work too, Gosh, even a "terminal" like the
ADM-3 should still be available at swap meets.

I'm kidding. A 486 is probably all you will find anymore that still
works, and has the speed and memory to run windows 95/98, and
the BIOS can handle modern interface cards without randomly
locking up or getting a blue screen of death (BSOD).

There was nothing wrong with the advice, and I don't know why
you feel the need to describe it as overkill, other than just to
show us your greater knowledge on the subject, and how stupid
everyone else is.

I find it amazingly ironic that you write the above paragraph and
then go on to write:

> There was nothing wrong with the advice, and I don't know why
> you feel the need to describe it as overkill, other than just to
> show us your greater knowledge on the subject, and how stupid
> everyone else is.

... this one.

Perhaps I should explain it simply to you, Steve, in short words ;-) This person
is looking for a terminal for a KPC-3. They're not likely to need to run Win9X
or plug in "modern interface cards".

From what I read, all they need is a machine that does a compentent job of
running a terminal emulator via a serial port. Like you, I point out that
older machines (I say pre-386) are not likely to have good software support
anymore.

Exactly how does this bit of advice on my part display arrogance?

The above isn't a proper response. Please quote the
wording that says you can't provide e-mail on ham radio
packet because e-mail is available from commercial
providers.

> granting full internet access.

Well at 1200 baud i wasn't about to "open up full access,"
just e-mail. I had about four users, and in a little over
a year, no junk e-mail had started coming thru. If it had
started to do so, i had a policy (and mechanism) to control
that. I'm not going to go into the details of the policy i
had because i don't have to defend it here ... suffice it to
say i was satisfied that i was doing what i needed to do to
protect my license. The ares/races and HF-god people in my

area wouldn't touch my system (good riddance) but one of the younger god-approved sysops did put a notice to HIS users that i was on frequency and he put a node connection available to his users in order for them to get to me. I moved away from that area (1998), else i'd still be doing it.

The scores of people i was in touch with (via an e-mail list) who were/are doing the same thing i was, reported that they'd never yet had problems that could get them canned.

The hams in the San Francisco bay area who had 100K+ capability told me that THEIR problem was that no one was interested in playing with them ... the equipment starts getting pricey. So, ham radio dies for lack of interest...

9600 baud true FM radio

Remember that the faster the packet with less retries increases
bandwidth potential with less packet clashing. So most true FM rigs ie;
allmodes,does not cut it unless the linearity of receiver IF having a min of
11khz this is needed for efficient RX of 9600 baud packets TXD needs to be
shorter as well like about 70ms or so. Just a thought remember its FSK not AFSK!

Yes the Tekk Radios and modified Motorola Mitreks and Micors seem to
work very well on our 9.6kbs LANS in Chicago land area.

Rob, DHCP translation logging still gives point of origin! Dynamic ip's
are masked to the server Ip. Its just a way to filter those who are abusive
is all. The other server users may loose out oh well! Such is life on the
gateways eh? Remember there is always reverse hop check translation.

There are certainly many ways to filter ampr only logins, permission
restrictions ect. Its just a start and fair way warning to all. We all have to
start somewhere ya know. Thanks for the input.

DHCP translation logging? Please explain?

DHCP is *not* involved in the typical PPP dialup (with dynamic IP).

How are you doing the masking? It is difficult/impossible to know how far
a subnet extends knowing only the IP address.

reverse hop check translation? You mean traceroute? Used to work fine,
but is crumbling because of the filtering that many ISPs are installing,
and the lack of reverse DNS entries (partly because of the way IP addresses
are assigned now) isn't helping either.

Rob

The Radio,Computer & Electronics Show takes place on Sunday 15th October at
THE NEWPORT CENTRE, NEWPORT, Sth WALES just 1 mile off junc`s 26 or
25a M4.

The show opens at 11.00am

Many new and all the regular traders attending, plus specialist groups
including
the R A with their test gear, bring and buy, refreshments and BAR.

Want to sell that radio/computer gear or W H Y, too much for the bring and
buy then hire a table.

Contact FIREHAM@AOL.COM now to book or for more info.

Traders ring 07970 777756 now.

Come to NEWPORT the GATEWAY of WALES.

I have used an old PC clone of the origional msdos pc. An 8088 computer with 640 K of memory and a 10 meg hard drive. Anything that you can run a simple terminal program on will work. Might not do much of the fancey stuff, but will work fine for the text.

I would have thought by now the packet stuff would have gone by the wayside. Unless chasing DX and using the DX cluster I jsut can't see very much use for it now with all the other modes out. Seems too slow to me. A few years back a friend and I were talking on 2 meter ssb about 150 miles apart. Decided to see how we could work packet via the digipeaters. Seemed to take about 5 minutes or more to get the messages one way. Probably not too bad, but not very good for real time communications.

Vista Print is offering 250 free business cards that make great 'eyeball'
QSL's cards.

These cards are in full color, and look great.

You design the cards with software that runs in your browser.

Then pay a small shipping fee for them. (currently less than $5 in the US)
You can also order more than 250 at a discounted price.

The link is:
http://service.bfast.com/bfast/click?bfmid=26298982&siteid=34622821&bfpage=88by31links

(disclaimer: I don't work for VistaPrint, but I am one of their customers,
and affiliets. If you don't approve of me making fellow hams aware of this
offer, while getting affiliet points, please feel free to go direct to
vistaprint.com without using my link. They will still give you the 250 free
cards. [enjoy])

One could debate the definition of "regular basis". But the rule is there just the same. I find that gating E-mail from the internet to a packet radio mail address, is perfectly fine. Where people like Stew cross the line, is when they start talking about apps that access the weather, stock quotes, horoscopes, games, and other activities that are clearly not within the purpose of ham radio. Such activities ARE available through normal commercial providers, and since these are commercial venture, they may be in violation of the "no business" rules as well.

These rules were deliberately and thoughtfully created to prevent people from duplicating the communications efforts of the telco industry, on a large scale. If these rules were not in place, hams could theoretically create a network that provided a service to the populous at large, while bypassing many of the legal, and regulatory issues that commercial providers must deal with, thereby giving the "amateurs" an unfair competative advantage.

Yes, it's about money (isn't always?). The powerful lobbies of the telco industry were effective at setting these rules in place.

If the purpose of your station is to make it look like some other
licensed service, then the thinking is, that you are not in the
hobby for the right reasons.

The purpose of ham radio is purely hobby, with operators
discussing things that have to do with radio, or experimenting
with radio modes.

Once that mode is established as an accepted part of the hobby,
it cannot be used to provide any services that you would otherwise
be expected to pay for, or subscribe to.

There is the disaster services aspect, but this has been pretty
much overshadowed by FEMA, and is mostly redundant.

The best band to use today, for non-hobby communications,
is Part-15 allocations (this includes many ham frequencies, as
Part 15 covers almost all of DC to Light. The best bands though,
are the ones that authorize Spread Spectrum, and these allow
power levels and antennas that are useful.

I have discovered AE4JY's PSKCORE.DLL that allows you to implement PSK31 support in your own 32-bit Windows program. I will be developing some custom radio control software for my new TenTec Pegasus transceiver and plan on using PSKCORE.DLL to provide support for PSK31. I am looking for similar tools for other modes using the soundcard, such as RTTY, AMTOR, CW (receive), SSTV or any other modes (THROB, Piccolo ?). The software I am writing will be in Borland Delphi and run on Windows 95/98/NT. I should be able to work with a DLL written in other languages as well.

Well, thanks for the quote. In spite of this, the FCC
hasn't moved to shut down all those scores (hundreds?)
of jnos-tnos-xnos stations. I will operate if i choose
to, given that apparently the FCC isn't interpreting its
rules in the same way you seem to. Also, I doubt that
any of my users 1997-98 had other RADIO access to
internet e-mail.

Apparently the situation in the USA is the same as over here: content restriction violations on amateur band (and other similar violations that do not put other users of the radio spectrum in danger) are extremely low priority. This is equal to "never get handled unless asked for by some official in the amateur radio society".

Ask some ARRL official to call them and they are shut down the next day.

4304. Innovation and Ham Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-10-11 00:00:00 UTC
From: helpfull@my-deja.com
Message-ID: <8s2hfc$s35$1@nnrp1.deja.com>
Source record: 10549

IMHO....

I tired of hearing that Ham radio is just a hobby. Of course it's a hobby
but that's not all. I'm not talking about emergency services either. That's
all well and good and may be one of the reasons our bands still exist but
I'm sick of the politics.

If all we're doing or allowed to do is help each other set up stuff and
enjoy the fun of getting it working; what then? Are we to do
nothing but test our SWR and call it a hobby. If you keep saying what Ham
radio is NOT then you're cutting it off at the feet. Why the hell would
anyone want to be a "Ham" once the "fun" of setup is over? It limits the
hobby to smart asses.

The point is, WHERE'S THE BENEFIT? We need to be flexible about Internet
connectivity and new methods. Everyone is quick to say that packet has been
hit hard by the internet. Yet not enough say what CAN packet do that's
different. Plus, stop the either or one sided thinking! For example, use the
darn Internet when it makes since. If you want to brag about not using
anything but radio, fine. Yet keep your mouth shut when others do their
thing. Too many "rule police" are self righteously killing Ham radio!

Sure I know, we need rules else it would be like CB. I understand that. But
that's not even the issue. We're not talking about childish repeater abuse
here. We're talking innovation. That is going to mean change. Too many of us
simply fear change. Stop it!

If everyone listened to the nit-picking rule police then NO ONE would join
the hobby/service. To the nay-sayers, I don't recommend breaking the
law. My disagreement is the suggestion that *YOUR* view of Ham radio should
be my view. Isn't it (after all) what we make of it? So first check you pride
and arrogance at the door and remember we're talking about sharing the bands
here and not murder. Don't be naive about the money involved and special

interests too.

It's been said that the telephone lobbies promoted much of part 97 to keep
everyone from using Ham radio instead of the phone system. While it's widely
debated what the purpose and *true* intent of Part 97 is; we need to keep an
open mind. We need to consider change. We need to know our vote counts *and*
we can change the rules as new innovation necessitates.

So I hope you all get the point. There needs to be an attraction to ham
radio other than just being technical. It's fun but why are we spending
good money on equipment? Why are we training our selves in proper techniques?
Why are we focusing on features and not benefits? Why is every real benefit
seemingly shot down by outdated rules while ham radio dies off with it's old
guard? CHANGE people, is a good thing. I suggest you get used to it. You
haven't a choice in this regard. The goal is communication.

So I'd like to think Ham radio is about scientific exploration. New benefits
from the new features, methods, and technology. I'd always considered Ham
Radio to be the place for "do it yourself" radio innovation. It's a free
county is it not. I hate politics but do you see there's money interests
involved? So I say create first and then change the rules to back up your new
benefit, if needed. Sure move to MURS or Part 15 or whatever if you need to.
Yet, What's happening to Amateur Radio?

A pet peeve of mine is the "Amateur" in Amateur Radio. Just a thought. Why
not call it Scientific Radio instead? Are we not promoting professional
operator techniques? Professional doesn't mean money per say. It means
professional. It means practiced. It means wise and it means benefits with
communications. Is there a problem with calling it Scientific Radio? I guess
we'll always be Hams. That is, if we still have a band to use.

It would be nice if "Hams" were thought of as being smart and not smart
asses. Watch out that you're not a smart *ass*. Sure be technical but get
real. We need to respect all operators regardless of technical
knowledge. Many spouses both technical and not so technical have joined
in and all to our benefit. Plus, few debate the need to attract a young
person (or old) who is just learning.

Further, why not even be known for caring first. Care about people. Isn't that the reason for communication in the first place? Let's add to our ability to care for people, like when we connect them to their loved ones in an emergency. Let's be known for our scientific innovation AND how it benefits all. Let's even be known for pointing out where big business seeks to control the airwaves and our pocket books. Why not make free wireless communications available to the masses. Why not? Who say's we must pay a toll? It's completely up to you.

Further I'll even say we need privacy and that includes encryption. Now I realize this is very controversial. I will tell you why. We need innovation in our thinking here. The standard government rant goes like this...we can't give encryption to the public, they say. Then some evil interest would communicate about destroying us and we wouldn't be able to listen in. Therefore (they say) our freedom is in jeopardy. They say it's a national security issue. So they control our privacy for the sake of security. This is in fact, our current situation if you didn't know it. We have no communications privacy.

So what's the problem with that? After all, what do you have to hide, right?
WRONG! Have you not heard about the epidemic of identity theft for one example? Do you believe everyone and anyone has a right to know anything and everything about you? I think that's God's job. It is not the governments.

We are allowing the government to trade our privacy for security. Well isn't privacy a freedom we have fought and our forefathers have died for all these years.
Isn't that like giving up the war to all comers, anyway? I believe it was Ben Franklin who said "If you give up your privacy for security, you will have NEITHER!". The problem is the men in government seek to *CONTROL* those not in government unfairly. Why is it OK for our government to have privacy and not it's people? If you see the government as your savior, I suggest what you don't know *can* hurt you. This has never been as important as it is today. Many are now realizing all too late, their privacy matters. Don't be too late, it matters.

So if you're one of the few who truly promote innovation and you are
kind
enough to do it with Amateur Radio, please don't give up. Focus on real
communication benefits for people. Embrace change and do something
about it.

You can do the same thing with Microsoft Publisher and print them yourself for free. Probably any publisher program will do this for you. Why pay someone else to do this if you don't have to.

Many prohibitions, here is one:

S 97.113 Prohibited transmissions.

(a) No amateur station shall transmit:

(5) Communications, on a regular basis, which could reasonably be
furnished alternatively through other radio services.

You are dead meat.
The above is a good advertisment to draw crackers.
Simple source ip hack, and I come from any ip I want you to see.
Plenty of open relays around, I could use one of them. They keep no logs..

But this whole topic has nothing at all to do with ham radio.

Refering to the rule about prohibition on radio services REASONABLY provided elsewhere and combined with thinking about "cellular" now doing Internet connetivity so hams can't; I submit the following.

Whew! Since "cell" phones don't provide any service at a reasonable price; the point is mute. :)

Well, I heard that Tom Sailer is working on a new version of
the soundmodem that runs in userspace and uses the normal OSS
sound drivers. The NEWQPSK implementation for Linux already does
this, as does the latest hfmodem stuff.

Ah... I may have another look at it. Fortunately I am now running OSS,
as my new soundcard is not supported by ALSA. But my old soundcard was,
and worked terribly in OSS. So then I used ALSA.

In general, the whole issue around APIs is widely underestimated by the
Linux development community. New APIs for existing services are invented
at will, whole C libraries are changed for mostly political reasons, etc.
This confuses the users who are accustomed to a platform where most
existing applications do not break when a hardware interface card is
replaced, or an upgrade of the system is installed.

A more stable and unified API would help the availability of (semi)
commercial applications, but apparently that is not a priority for
Linux developers. This sometimes is a shame.

There are (at least) two APRS networks here in Oregon.

Check 144.390 and 145.750, you will find a lot of activity,
and plenty of folks to contact for ideas for your project.

4330. The search for a gene...

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-10-12 00:00:00 UTC
From: analog24@webtv.net
Message-ID: <13103-39E67A22-6@storefull-177.iap.bryant.webtv.net>
Source record: 10569

GENETIC
FACTOR EYED

Biofeedback Systems in Los Angeles, is looking for volunteers with a rare genetic inheritance, to participate in a proprietary study.

At present, it is believed that fewer than one person in 400 carries a rare genetic makeup that predisposes them to having better health than most, a strong immune system, and an unusually high energy level. Aside from behavioral manifestations such as a generally positive outlook on life, the principal evidence that this genetic factor is present, is mirrored in the shape of the eyes.

It should come as no surprise then, that the eyes themselves would be used to select the people who are nost likely to have this elusive gene. Individuals selected for this study will be white, Caucasian, of either gender, and between the ages of 25 and 50. Compensation will be determined by a collective evaluation of the total number of applicants selected. Drugs will not be administered as a part of the study.

The eye contour that embodies the required genetic trait, has been roughly described as "almond shaped," but this is not an adequate definition. Exact specifications follow.

Looking in the mirror with the head level, the qualified applicant will see that the lower half of their eyelid is CONVEX UPWARD, from the bottom on either corner. The bottom part of the iris will be partially covered by the lower eyelid (this is important), and there will be a reasonable symmetry between the eyes on the left and right side of the face.

Applicants must submit a close-up facial photograph for evaluation. Since no risk or disease factors have been associated with this gene, any risk to volunteers in the study is contraindicated. Interestingly, it is apparent that the "energy gene" as it has been called, may be dormant in one or both parents, yet it may be actively transmitted to their children; but it is only infrequently active among two or more siblings.

If you know of a person, or happen to notice one whose eyes might qualify them for this study (preferrably among those employed in the technical community), you may want to share this data with them. Since so few people are fortunate enough to carry this gene, your only encounter with one of them may be in a fleeting moment. It would be wonderful if you had a copy of this announcement with you, and could share it with a prospect in passing. Alternatively, you could specify this website and posting date, or perhaps my email address.

They may then contact Mr. Norman Swartz at this

[virus-proof] email address: analog24@webtv.net (It is not generally realized that, because webtv has no hard drive, it is immune to destructive computer viruses.) Or, they may write to: Biofeedback Systems, Post Office Box 8501, La Crescenta, CA 91214. No telephone calls please. Depending upon the number of volunteers selected, applications will be accepted through the end of December 2000, with a possible extension through 31 January 2001. The duration of the study will be a minimum of two years.

4331. Electrocomm Automation Rim-960 / conversion to AX.25

I have a GE Mastr III UHF repeater that came with a super neat looking radio modem made by Electrocomm Automation that is rack mount and consists of two seperate plug in cards into a 2 inch high 19 inch rackmount housing. The two cards are a RIM (radio interface module , for converting station alarms to modem inputs and a Protocol converter, to convert radio data in the EA proprietary 9600 baud format to a RS-232 serial data link over a 14.4 lease line modem on the shelf above. If anyone has experence in making firmware or knows a source for same I would greatly appreciate it. I hate the idea that it is a garbage can liner device and would like to put it to good use..Jeff

If you are going off to college, think about building or buying a reasonably up to date PC that you can network into the dorm internet system. During the course of your studies you are likely to encounter situations where you will be given documents in Word or Excel and you'll be expected to open or submit in the current version formats. You can build a very good computer these days for relatively little cash. Older 486 machines just don't have the muscle to handle Windows ME or 2000. I'm an old Mac guy too but use both becasue of what the software demands. In a college environment you will discover that most schools are set up to troubleshoot PC's though.

I don't know about Colleges, but many Universities will now tell you which
computer to show up with. For example, many engineering schools specify
a laptop and a wireless pcmcia. One guy at work put together a machine
for someone's daughter, who was going to a University. They told her it
wasn't good enough to hook to the network, or complete her assignments.
Father was a little pissed, but bought the specified Dell...

Best answer: Buy what the school recommends.

Rob Janssen <nomail@rob.knoware.nl> wrote:
> A more stable and unified API would help the availability of (semi)
> commercial applications, but apparently that is not a priority for
> Linux developers. This sometimes is a shame.

Sometimes. The kernel does seem to have good backwards compatibility
though, which is certainly an asset. Or sometimes the userspace tools
will emulate an old interface. For example the upgrade from ipfwadm
to ipchains in Linux 2.0 to Linux 2.2.

The sound API is a definate sore point. Plain sampling can be
done by reading /dev/dsp or /dev/audio, but anything fancy
like setting the sampling rate requires IOCTLs, which aren't
necessarily standard between ALSA and OSS.

I'm happy to see OSS die out, unless 4Front-Tech stops
the OSS/Linux versus OSS/Free thing (unlikely).

4349. MixW32 New Version

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-10-15 00:00:00 UTC
From: Dave deSouza <g3vfp@btinternet.com>
Message-ID: <8sccbogju1@plutonium.btinternet.com>
Source record: 10591

Hi guys.

Just to say that Nick UT2UZ has released version 1.45 of MixW32.

I have it on my download page if you need it.

http://www.g3vfp.co.uk

Best Regards,

Dave G3VFP.

4350. FS Kantronics KAM Enhanced

Newsgroup: rec.radio.amateur.digital.misc

Yes, I have also used logger. There is a software module that you have to download with Logger that allows it to operate with the 1278B.

Regards,

Duffy - WB8NUT

Debatable whether this is "digital" or not, but it's required for a "digital" application - does anyone in the UK have one of the old Datong Woodpecker Blankers which they wish to sell?

Please email me directly if so.

Bob, G8IYK

4355. here is a patch to fix runtime errors on fast machines using lan-link

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-10-15 00:00:00 UTC
From: Steve Fleckenstein <spfleck@warwick.net>
Message-ID: <8sdlrn$d9v$1@news.warwick.net>
Source record: 10597

I'm sure some one must have come across this before.. I've always liked lan-link but it would always fail on my Pentium II 266mhz machine.. run fine on the old 8088 IBM pC in the garage. I got Runtime error messages. I found out this is a failure of an internal timing calc built into Borland Turbo Pascal code. I was running lan-link v2.34.

The fix is to patch the lan-link exe files using tppatch.exe found on the following website:

http://www.brain.uni-freiburg.de/~klaus/pascal/runerr200/download.html

Making Money Faster than you ever have before.... And do it while your =
sleeping

READING THIS COULD CHANGE YOUR LIFE! I found this on a bulletin board =
and
decided to try it. A little while back, I was browsing through =
newsgroups
I came across an article similar to this that said you could make =
thousands of dollars within
weeks with only an initial investment of $6.00! So I thought, "Yeah =
right, this must be a scam", but
like most of us, I was curious, so I kept reading. Anyway, it said that =
you send $1.00 or $2.00 for Canadian=20
citizens to each of the 6 names and address stated in the article. You =
then place your own name and address=20
in the bottom of the list at #6, and post the article in at least 200 =
newsgroups. (There are thousands) No
catch, that was it. So after thinking it over, and talking to a few =
people first, I thought about trying
it. I figured: "what have I got to lose except 6 stamps and $6.00, =
right?" Then I invested the
measly $6.00. Well GUESS WHAT!! Within 7 days, I started getting money =
in the mail! I was
shocked! I figured it would end soon, but the money just kept coming in. =
In my first week, I made
about $25.00. By the end of the second week I had made a total of over =
$1,000.00! In the third
week I had over $10,000.00 and it's still growing. This is now my fourth =
week and I have made a
total of just over $42,000.00 and it's still coming in rapidly. It's =
certainly worth $6.00, and 6
stamps, I have spent more than that on the lottery!! Let me tell you how =
this works and most
importantly, why it works. Also, make sure you print a copy of this =
article NOW, so you can get
the information off of it as you need it. I promise you that if you =
follow the directions exactly, that
you will start making more money than you thought possible by doing =
```

something so easy!
Suggestion: Read this entire message carefully! (print it out or =
download it.) Follow the simple
directions and watch the money come in! It's easy. It's legal. And, your =
investment is only $6.00
(Plus postage) IMPORTANT: This is not a rip-off; it is not indecent; it =
is not illegal; and it is
virtually no risk - it really works!!!! If all of the following =
instructions are adhered to, you will
receive extraordinary dividends. PLEASE NOTE: Please follow these =
directions EXACTLY, and
$50,000 or more can be yours in 20 to 60 days. This program remains =
successful because of the
honesty and integrity of the participants. Please continue its success =
by carefully adhering to the
instructions. You will now become part of the Mail Order business. In =
this business your product
is not solid and tangible, it's a service. You are in the business of =
developing Mailing Lists. Many
large corporations are happy to pay big bucks for quality lists. =
However, the money made from
the mailing lists is secondary to the income which is made from people =
like you and me asking to
be included in that list. Here are the 4 easy steps to success: STEP 1: =
Get 6 separate pieces of
paper and write the following on each piece of paper "PLEASE PUT ME ON =
YOUR MAILING
LIST."Now get 6 US $1.00 bills or a Twoonie and place ONE inside EACH of =
the 6 pieces of paper so
the bill will not be seen through the envelope (to prevent thievery). =
Next, place one paper in each of
the 6 envelopes and seal them. You should now have 6 sealed envelopes, =
each with a piece of
paper stating the above phrase, your name and address, and a $1.00 bill =
or Twoonie . What you are doing is
creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting a =
legitimate service and
you are paying for it! Like most of us I was a little skeptical and a =
little worried about the legal
aspects of it all. So I checked it out with the U.S. Post Office =
(1-800-725-2161) and they
confirmed that it is indeed legal! Mail the 6 envelopes to the following =
addresses:

#1)Sherry Beth 345 Pacific Ave. N. #DD7 Pacific, WA 98047 :=20
#2)Joseph Erickson 16050 Hare Creek road - Corry, PA 16407 :=20
#3)Fabien Thillet 1836 Beach Drive, Box 36 Gulfport 39507, MS
#4)R. Blair 418 10th Ave NW Calgary, Alberta, Canada t2m0b5
#5)R. Bates 620 Crescent R.D N.W Calgary, Alberta, Canada T2M-4A6 <----- =
Very popular list

#6)Franck-Alix Julien 1090 kristin way Apt. 811, Ottawa, Ontario, Canada =
K1K4B6 <----- Very popular list
if more money is sent time on the list is then increased

: STEP 2: Now take the #1 name off the list that you see above, move the =
other names up (6
becomes 5, 5 becomes 4, etc...) and add YOUR Name as number 6 on the =
list. STEP 3: Change
anything you need to, but try to keep this article as close to original =
as possible. Now, post your
amended article to at least 200 newsgroups. (I think there are close to =
24,000 groups) All you
need is 200, but remember, the more you post, the more money you make! =
This is perfectly legal!
If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal =
lottery laws. Keep a
copy of these steps for yourself and, whenever you need money, you can =
use it again, and again.
PLEASE REMEMBER that this program remains successful because of the =
honesty and integrity
of the participants and by their carefully adhering to the directions. =
Look at it this way. If you are
of integrity, the program will continue and the money that so many =
others have received will come
your way. NOTE: You may want to retain every name and address sent to =
you, either on a
computer or hard copy and keep the notes people send you. This VERIFIES =
that you are truly
providing a service. (Also, it might be a good idea to wrap the $1 bill =
or a Twoonie for Canadian citizens
in dark paper to reduce therisk of mail theft.) So, as each post is =
downloaded and the directions=20
carefully followed, sixmembers will be reimbursed for their =
participation as a List Developer with one dollar each.=20
Your name will move up the list geometrically so that when your name =
reaches the #1 position you will
be receiving thousands of dollars in CASH!!! What an opportunity for =
only $6.00 ($1.00 for each
of the first six people listed above) Send it now, add your own name to =
the list and you're in
business! DIRECTIONS FOR HOW TO POST TO NEWSGROUPS------------ STEP 1)
You do not need to re-type this entire letter to do your own posting. =
Simply put your cursor at the
beginning of this letter and drag your cursor to the bottom of this =
document, and select 'copy' from
the edit menu. This will copy the entire letter into the computer's =
memory. STEP 2) Open a blank
'notepad' file and place your cursor at the top of the blank page. From =
the 'edit' menu select
'paste'. This will paste a copy of the letter into notepad so that you =

can add your name to the list.
STEP 3) Save your new notepad file as a text file. If you want to do =
your postings in different
settings, you'll always have this file to go back to. STEP 4) Use =
Netscape or Internet explorer and
try searching for various newsgroups (on-line forums, message boards, =
chat sites, discussions.)
STEP 5) Visit these message boards and post this article as a new =
message by highlighting the text
of this letter and selecting paste from the edit menu. Fill in the =
Subject, this will be the header that
everyone sees as they scroll through the list of postings in a =
particular group, click the post
message button. You're done with your first one! =
Congratulations...THAT'S IT! All you have to
do is jump to different newsgroups and post away, after you get the hang =
of it, it will take about
30 seconds for each newsgroup! **REMEMBER, THE MORE NEWSGROUPS YOU POST
IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM
OF 200** That's it! You will begin receiving money from around the world =
within days! You may
eventually want to rent a P.O.Box due to the large amount of mail you =
will receive. If you wish to
stay anonymous, you can invent a name to use, as long as the postman =
will deliver it. **JUST
MAKE SURE ALL THE ADDRESSES ARE CORRECT.** Now the WHY part: Out of 200
postings, say I receive only 5 replies (a very low example). So then I =
made $5.00 with my name at
#6 on the letter. Now, each of the 5 persons who just sent me $1.00 make =
the MINIMUM 200
postings, each with my name at #5 and only 5 persons respond to each of =
the original 5, that is
another $25.00 for me, now those 25 each make 200 MINIMUM posts with my =
name at #4 and
only 5 replies each, I will bring in an additional $125.00! Now, those =
125 persons turn around
and post the MINIMUM 200 with my name at #3 and only receive 5 replies =
each, I will make an
additional $626.00! OK, now here is the fun part, each of those 625 =
persons post a MINIMUM
200 letters with my name at #2 and they each only receive 5 replies, =
that just made me
$3,125.00!!! Those 3,125 persons will all deliver this message to 200 =
newsgroups with my name
at #1 and if still 5 persons per 200 newsgroups react I will receive =
$15,625,00! With an original
investment of only $6.00! AMAZING! When your name is no longer on the =
list, you just take the
latest posting in the newsgroups, and send out another $6.00 to names on =
the list, putting your

name at number 6 again. And start posting again. The thing to remember =
is: do you realize that
thousands of people all over the world are joining the internet and =
reading these articles
everyday?, JUST LIKE YOU are now!! So, can you afford $6.00 and see if =
it really works?? I
think so... People have said, "what if the plan is played out and no one =
sends you the money? So
what! What are the chances of that happening when there are tons of new =
honest users and new
honest people who are joining the internet and newsgroups everyday and =
are willing to give it a
try? Estimates are at 20,000 to 50,000 new users, every day, with =
thousands of those joining the
actual internet. Remember, play FAIRLY and HONESTLY and this will really =
works !!

about
30=20
seconds for each newsgroup! **REMEMBER, THE MORE NEWSGROUPS YOU =
POST
IN, THE=20
MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM
OF 200** =
That's it!=20
You will begin receiving money from around the world within days! You=20

may
eventually want to rent a P.O.Box due to the large amount of mail =
you=20
will receive. If you wish to
stay anonymous, you can invent a name to =
use, as=20
long as the postman will deliver it. **JUST
MAKE SURE ALL THE =
ADDRESSES ARE=20
CORRECT.** Now the WHY part: Out of 200
postings, say I receive only =
5=20
replies (a very low example). So then I made $5.00 with my name at
#6 =
on the=20
letter. Now, each of the 5 persons who just sent me $1.00 make the =
MINIMUM=20
200
postings, each with my name at #5 and only 5 persons respond to =
each of=20
the original 5, that is
another $25.00 for me, now those 25 each make =
200=20
MINIMUM posts with my name at #4 and
only 5 replies each, I will =
bring in an=20
additional $125.00! Now, those 125 persons turn around
and post the =
MINIMUM=20
200 with my name at #3 and only receive 5 replies each, I will make=20
an
additional $626.00! OK, now here is the fun part, each of those =
625=20
persons post a MINIMUM
200 letters with my name at #2 and they each =
only=20
receive 5 replies, that just made me
$3,125.00!!! Those 3,125 persons =
will=20
all deliver this message to 200 newsgroups with my name
at #1 and if =
still 5=20
persons per 200 newsgroups react I will receive $15,625,00! With an=20
original
investment of only $6.00! AMAZING! When your name is no =
longer on=20
the list, you just take the
latest posting in the newsgroups, and =
send out=20
another $6.00 to names on the list, putting your

name at number 6 =
again. And=20
start posting again. The thing to remember is: do you realize =
that
thousands=20
of people all over the world are joining the internet and reading these=20
articles
everyday?, JUST LIKE YOU are now!! So, can you afford $6.00 =
and see=20
if it really works?? I
think so... People have said, "what if the =
plan is=20
played out and no one sends you the money? So
what! What are the =
chances of=20
that happening when there are tons of new honest users and new
honest =
people=20
who are joining the internet and newsgroups everyday and are willing to =
give it=20
a
try? Estimates are at 20,000 to 50,000 new users, every day, with =
thousands=20
of those joining the
actual internet. Remember, play FAIRLY and =
HONESTLY and=20
this will really works !!

From: zl2bmh <zl2bmh@free.net.nz>
Message-ID: <971585162.242320@news>
Source record: 10588

Hello all.

I need some help getting my Chromopix SSTV interface working. I have had it since it was made available and I have had a trouble free run with it. This runs from the sound card.

About a week ago I started having problems. At about that time I installed 'LOGGER" forPSK31. there appeared to be a conflict between the two. Everytime I started 'logger' it would immediately bring the FT990 transmit led on. It really was in a 'ready to go' position. So I had to switch off the TXmitter and the computer (making sure that 'logger' was in the off position). In doing this I can now use the computer and radio as one or separately.

I uninstalled the 'Logger' software and I still have the same problem mentioned above.

Would some kind amateur please help me sort this out.

Many thanks
Jim. (zl2bmh@free.net.nz)

Hi Paul,

I prefer APRS+SA it uses the Delorme maps which I happen to like.
The author seems to keep up a bit better with changes in APRS than
the WinAPRS folks do. I have founsd the author quite responsive to
probelms and issues although he has a serious day job and only does
APRS+SA on the side.

Check out Creative Services Software at http://www.cssincorp.com/
They have a package for either TNC and if you only want VHF packet the
software demo is free. You can't do much better than that and the software
actually works and has excellent support from the company.

Ideally, it's a sequence of flags. What makes you think it isn't a
flag sequence? What are you listening to? I suppose it doesn't
actually matter all that much as long as a flag preceeds the
actual frame (I might have heard a TNC out there that sends
alternating raw 0/1 before NRZ-S decoding). Most TXDelay
tones I've heard are flags.

I'm not sure what API(s) you're referring to here, but the OSS API hasn't
changed significantly in a good long time. There is no difference between
the OSS/Free and commercial OSS APIs.

ALSA does indeed have it's own API, but you don't get new functionality
without a change in the semantics of the interface.

> A more stable and unified API would help the availability of (semi)
> commercial applications, but apparently that is not a priority for
> Linux developers. This sometimes is a shame.

Of course it is a priority for Linux developers, but with anarchic development
you don't settle on an API until you know you have it right. Until it's "right"
it's a free-for-all .. that's how you avoid costly longer-term mistakes.

> necessarily standard between ALSA and OSS.

I'm not sure what your argument is here. Are you somehow suggesting that
the ALSA and OSS APIs should be the same? Or just that they should be ioctl()
compatible for common functions? In time one of them will come out on top
and will become the standard sound API.

> I'm happy to see OSS die out, unless 4Front-Tech stops

Why? Because noone is developing the drivers you want for OSS/Free?

I see little value in undermining OSS/Free. It is free software that anyone
could add appropriate or additional drivers to should they so please.

I've no qualms with 4Front-Tech offering a commercial version .. I'll never
use it .. but they're entitled to do as they please in that respect. I've also
no qualms if they want to differentiate their commercial offering by time-lags
in card support, again, that's entirely their prerogative. I'm guessing in
some cases the lack of support for some soundcards in OSS/Free has more to
do with NDA's imposed by the vendor than any commercial decision on the part
of 4Front-Tech.

4374. MURS

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-10-16 00:00:00 UTC
From: Rally The Sheep <nospam-rallythesheep@crosswinds.net>
Message-ID: <sun04mkug93s66@corp.supernews.com>
Source record: 10464
Cross-posted to: alabama.birmingham.radio.amateur,alt.ham-radio.packet,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy

In case ya'll haven't heard, on July 12th
the FCC created the Multi-Use Radio Service.
It's for people who want to be on the radio
but don't want to have to learn all the rules and
stuff for the amateur service. The difference between
MURS and CB is that MURS will have repeaters, packet,
data, imaging and, like CB, won't have any regulations.
Oh, there is one regulation, you can only transmit up to 2
watts of power. (I got this info from QRZ.com, the like to
the article below).

The full article is here:

http://www.qrz.com/articles/00/10/15/1215251.shtml

My personal opinion (which probably doesn't mean much
to anyone but me), is that the FCC isn't going to stop at the MURS service.
They're just going to continue on, and eventually, the entire amateur
service
will be regulation free.

What's your opinion?

Anyway, the reason for this posting is because most people don't
know about the MURS service.

(I'm probably gonna get tons of spam from this, too.)

73,

Thanks Bob for the kind works..

FYI, you can sync Pacterm/Pkterm and MultiComm Host's windows with
Logwindows, DX4Win and soon Logic 5. This way, you can have your TNC in
host mode, and use it not only for packet spots, but logging also.

4378. Re: Not, get UI-View, was: WinAPRS, Buy or NOT to Buy?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-10-16 00:00:00 UTC
From: Dean Martin <Dean.Martin@sands.vegas.com>
Message-ID: <sunam4alkfmce@corp.supernews.com>
Source record: 10468

I would say avoid WINAPRS. I'm a registered user, and I quit
using it about a year ago ($60 registration fee). Since then I am an
avid UI-View32 fan (about $20 +/- the exchange rate). WINAPRS
is a Win 3.1 program, and it is visually unappealing.

I use Street Atlas 7.0 and UI-View works two ways with that.

1) You pick an area, use map grabber (a button) and it makes
it into a .BMP file with lat/lon of the top left and bottom right
corners. Drink this into Paint Shop Pro and play with the colors
and reduce colors/contrast and it's wonderful.

2) Instead of selecting a map, you select Street Atlas from the
map selection menu. Presto, the Icons show up on a map
sucked in from street atlas.

3) You can use any map you know where the top left/bottom
right points are, or any two points on the map. I have a few
aviation maps I like to view when I see air traffic (sectionals
and lows).

This is just my opinion, but I've tried them all, and UI-View
is the cream of the crop. Everything else is a poor substitute.

Here's Rogers signature block:

Roger Barker, G4IDE - roger@peaksys.co.uk
For UI-View go to - http://www.packetradio.org.uk
For WinPack go to - http://www.peaksys.co.uk

Right; my use of the term "ideally" indeed stems from the AX.25
spec's use of the term "should", but I am curious which implementation
seems to be doing something other.

I'm running an APRS Station in the car, with no TNC in the house. I've been using WinAPRS for a couple of weeks now, for TCP/IP Only, as I can't do anything else with a non-registered copy.

Because I have no TNC in the house, is it worthwhile Buying this software? How much will I actually be able to do without a TNC? Can I message local stations through Digipeaters, Just like I would be able to do with a TNC and a Radio?

Any information will be deeply appreciated. TIA.

Have you ever read the verse where Jesus said I and the Father (talking about God) are one? Or the verse in Acts that says there is no other name which can save you? Jesus is fully God and fully man, and therefore can call Himself both man and God.

Your points do not corrospond to the Bible. Read the Bible, forget your personal beliefs/bias and trust Jesus as your Lord and Saviour. Try reading John, Acts and Romans.

Randy

>Do you know which implementations have this problem?

I have no exact list. As you know, some software uses fixed buffer sizes
(and we have to hope that appropriate bounds checking is in place), while
others use dynamic buffers. Certain NOS versions will just extend the
buffer as long as data is received.

(but the same is true for transmit frames. you can easily crash many NOS
systems by sending a long series of large PING messages on a halfduplex
channel. they will happily receive all the pings and queue replies on
the transmit queue that can never be sent because you are transmitting.
after some time they will run out of memory)

I have bad feelings about this MURS thing...

What I can see happening on MURS is the same thing that happened on 11m CB. MURS'ers will buy inexpensive 2-meter FM amplifiers at hamfests and connect them between their MURS radios and their antennas. So much for the 2 Watt limit! No one pays attention to the 5 Watt limit on 11m CB either... they use 10 meter amps. With 2m amplifiers so commonly available for such little money, I think this will happen virtually overnight. MURS also allows external antennas. Soon, there will be MURS'ers using modified 2m directional antenna arrays and high-power amplifiers to work bootleg VHF DX.

Someone else has already pointed out that the MURS radios will be merely the existing "color dot" type radios re-hashed (including some of the frequencies that were once "color dot" frequencies, such as 154.600 MHz). This could pose a problem too. Many of your favorite fast food joints, such as McDonald's, Wendy's, and so on, use some of those same frequencies for the two-way radios in their drive-up lanes. Can't you just picture the MURS CB'ers, running high-power amplifiers, giving fits to the people working the drive-up lanes? It's gonna happen, folks!

There are countless thousands of "color dot" radios wasting away in closets and drawers since the advent of cheap and effective FRS radios. FRS offers 14 channels vs. one or two channels, PL tones for a degree of privacy, they cost half or less what the "color dot" radios cost, they offer similar range but the UHF signal seems to pass through buildings better than the VHF does, and FRS radios run on common household batteries instead of the usual NiCd packs. I guess the only big draw for MURS is going to be the ability to (illegally) use big amplifiers and to use powerful antenna systems. MURS will be a boon to the bootlegger, but of no value to the intended users. The FCC has bungled again!

Flame away, folks. I'm wearing my Nomex firesuit...

True, and some of us got in just to fly our RC planes on 6M. But, with good Elmers in the hobby, we can take that Codeless Tech and show him other, wonderful aspects of the hobby that 2m, low-power simplex can't compete with.

Don't jump all over me now, but I have been a ham for
30 yrs and am just now fooling around with digital modes.
Eventually I will try psk31. I just started using an older
MFJ 1278, and am hearing stations on 20m packet.
Is there a list somewhere that tells me what the purpose of
the station is? For instance, I heard KJ6EO last night, and
really could not tell what was going on.

Also regarding psk31, could I expect an old 486DX with
32mb of ram to work with any of the software out there?
If so, which ones?

Thanks

Doug, N4IJ

K5DH,
I agree, MURS is going to be subject to all the abuse that
other bands are subject to. It's a shame too, it could be a
fantastic oportunity, if everybody 'played' fair. There's
one 'happy' thought, though. Since it's VHF, it should be
easy to 'DF'.

Rally The Sheep,
Do you really see MURS as being threatening at all
to amateur radio? I don't. Seems more like the manufacturors
trying to revilalize their 'color dot frequency' radios.
I can see where there could be lots of interest in this.
As I read the proposal, it allows voice, and digital modes,
repeaters, and paging. By the way, it's 2 watts ERP, so
that opens up a bunch of antenna options. Interesting
options...

>the OSS/Free and commercial OSS APIs.

I am referring to the interfaces in the widest sense of the word, including
not only things like the sound, video, graphics, user-interfaces but also
system interfaces, C-libraries, file locations etc.

What I mean is the complete environment that an application is running in.
This environment has been changing so often that many applications are not
available for all possible environments, and thus are bound to certain
revisions or distributions.

Sure it is nice if the best possible API is invented, but there is not much
progress being specificially made in that direction. Face it, Windows has
many more usable APIs than Linux has. Of course this is because of the
development method used for Linux, but this certainly is a disadvantage
of that method. It would be better if APIs are designed "by mutual
agreement" and then the implementations would compete for the best result.

Rob

It is in the "mainstream TNC firmware".
From the TAPR TNC2 firmware 1.1.7 release notes:

Pre-frame sync of zeroes rather than flags for reduced
TXDELAY (the other station can lock on to your transmissions
faster).

A "diddling" TXDELAY/TXDELAYC interval replaces the familiar
"flagging" keyup time. Zeroes are sent for TXDELAY,
followed by the number of flags specified in TXDELAYC.

Apparently they believe that the 1/0/1/0 sequence (= NRZI encoded 00 bytes)
will lock the receiver quicker. Probably the receiver clock recovery PLL.

The disadvantage is that a noise spike may be detected as a FLAG, and then
the remaining 00 fillers are received as databytes until the leading flag
of the real packet arrives. This "phantom" packet is usually rejected due
to bad CRC. But I have demonstrated that sending a very long sequence of
bytes between flags will crash certain AX.25 implementations (by memory
starvation), so using this method at high datarates and/or long txdelays
may cause problems.
It also wastes processing power receiving and storing all these zeroes,
while a FLAG sequence will normally be handled internal to the HDLC
controller (without issueing interrupts).

When you are doing HDLC decoding in software anyway (Baycom, soundcard) and
there is appropriate bounds-checking and buffer size limitation in the
software, there will be no difference.

I'm just saying it's a mess. Yes, one will win in the future;
sooner rather than later, I hope.

>> I'm happy to see OSS die out, unless 4Front-Tech stops

I dislike OSS/Free and OSS/Linux because they have delayed the
development of a true free sound API, like ALSA. If it weren't
for OSS, I suspect a truely free project would have begun earlier.

None of them offer the same modes though. None of the three you name
do RTTY, AX.25, Pactor receive etc, which MixW does. So your
comparison is pointless.

Pactor receive is useful for PSK31 ops, so you can see which
Winlink user is QRMing you.

Just to add a little (as another very satisfied UI-View user). UI-View will
run "on top of" AGWPE -- so you can use a sound card as a substitute for a
TNC if you like.

I suggest UI-View instead. It's much easier to use, and cheaper.

I have a Radio Shack Pro 2050 Trunktracker and was trying to directly punch in the Talk group IDs with the frequencies I have.Could some explain to me in a email in the most simplest term how I can do this ? And also I have tried to searches for ID numbers and unable to understand why I am not hearing anything ,I have gone through all the different trunking levels,i.e., E2 800, E2 900, E2 Hi, E2 UHF, Ed,E1 and still I have not heard a thing . When go out of trunking mode I can hear all the activity going on. What am I doing wrong ? I am trying isolate some of the radio traffic that I do not want to hear like EMS ,but not the towing services that use the same frequencies. PLEASE HELP!!! Send all replies to me directly ,not through the newsgroup Thanks!!

Don't have that doc, is it available on the TAPR site?
Found 1.19 EPROM image, but did not find docs.
Will look a bit harder.

Poor Man's Packet and other Baycom-like devices are not
TNCs. They are modems, with the protocol processing done in
software. Modern implementations do all the processing in
software.

The TCM3105 modem chip these designs used is long obsolete
and unavailable in surplus. MX614 is a replacement, albeit
not a drop-in one.

I've been playing with some DSP stuff at home, and, for what
it's worth, every system I can hear from home sends flags
before it starts sending data.

I've seen satellite systems that use Manchester encoding to
address bit sync issues.

It might seriously cut into the No Code Tech future numbers. Lots of
them had no other goal in mind in ham radio than that sort of usage.

ftp://tapr.org/software_lib/tnc/tncnot.zip has the release notes for
1.1.0 through 1.1.7.

AFAIK the most recent image on the TAPR site is 1.1.8a. I don't think
Howie has given permission for TAPR to freely distribute 1.1.9, except
as an EPROM.

The soundcard modem implementation of HB9JNX did this (I don't know of
current versions though). Actually sending a 0-1 sequence is better for
clock recovery purposes...

4412. Attention Programmers - use MMTTY RTTY engine in your programs!

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-10-17 00:00:00 UTC
From: Casey <casey@nospam.here>
Message-ID: <3_1H5.6038$P7u.45088923@tomcat.sk.sympatico.ca>
Source record: 10497

The current version of MMTTY (v.1.59) has special provision for programmers. You can link your programs to MMTTY or use the MMTTY RTTY engine as part of your program.

You can only use MMTTY and the RTTY with programs that are distributed for free.

Check the MMTTY English Website for information, source code and samples
---

MMTTY users and programmers,

I have received many emails about the logging and contest utilities of MMTTY. I am sorry, I will not be able to accommodate all the requests in my limited time for the MMTTY development.

For this reason, I added the TNC emulation mode, which makes the PC running MMTTY act as a TNC. You can control the PC as a TNC by connecting to another PC with a null modem cable. This emulation mode, however, requires two PCs or one PC with three COM ports; it is not a smart implementation.

I asked Bob Furzer, K4CY, for any good idea. He has quickly proposed a method using a simple inter-process communication (many thanks to Bob). This method makes it possible for MMTTY to easily communicate with other applications without using Windows registry. Based on his idea, I added a remote control mode to MMTTY. According to the discussion with Bob, I have incrementally added various functions to the mode. You can make full use of these functions.

Although I explain the usage of the functions in C, you can use other languages such as Visual Basic because the API should be the same.

apparently, when i posted this message, many thought that i
was saying that murs is a competitor with amateur radio.
that is NOT the impression i meant to send.
at this time, i do not think that murs is a serious threat to ham
radio. and rememeber, when i gave my personal opinion, that's
just what it was. my personal opinion. i'm not saying that's what's
going to happen, that's just what i THINK might happen eventually.

so go ahead call me a pessimist. it's my PERSONAL opinion, for
the amusment of me.

4415. APRS help please

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-10-17 00:00:00 UTC
From: ckg@osu.edu
Message-ID: <39ecbcf2.33957755@nntp.service.ohio-state.edu>
Source record: 10500

Hello all.

I have been running a high profile digipeater for APRS for quite some time now. I ran it in terminal mode, and simply copied my APRS "data string" to my beacon text and set it to an hour. This worked great, and everybody liked the station.

I use a Kantronics 9612, and have the UHF side set to our local packet 9.6k backbone (none APRS).

I decided to install APRS, and cant seem to get the "data string" to tx on port one (VHF) only. I need to completely seperate the two ports...is this possible with APRS ver 2.4.6?

TIA

The AX.25 specification says that interframe time "should"
be filled with flags. So it appears that an implementation which
uses bit patterns other than flags is allowed by the spec.

From: David Snyder Hale <david@isi9.mtwilson.edu>
Message-ID: <8sgkc4$c8m$2@agate.berkeley.edu>
Source record: 10474
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

I'm thinking I might like to experiment with packet radio.

I have an FM radio, a couple of computers (386 DOS laptop, Mac PPC, SunSPARC workstation), and so now I guess all I need is a TNC of sorts.

I've read much of primers and faqs at the tapr.org web site.

I wonder if anyone has any suggestions on particulars for the TNC.

I might like to try APRS, as I have a GPS recevier, as well. I also might like to take the show on the road, if I ever get a PalmPilot (thinking about it).

So, I kind-of thought the PicoPacket TNC from PacComm looked nice.

I also have an old 73 magazine article on building the poor man's packet for the Mac, but I can't find the FSK modem anymore. Any other TNC construction articles?

Thanks for any input / suggestions / etc.

73,

Don't bother, this program is awful. The interface is ridiculous, and it
dose not even work that well compared to Zakanaka, Winpsk, or Digipan.
All fo those are free.

Perhaps one of the software based decoders could report what
it sees prior to the first flags, between flags during the interframe
time, and after the closing flags. There is at least one implementation,
as you mention, that does not "sound like flags". The TRS-80 S/W
implemenation may have sent something other than flags during
TXD ... and possibly the GLB controller did also. I remember some
discussion of this issue about mid 1984. Wonder if the NJIT conference
archives still exist somewhere, that's where the discussion took place.

My version of NET also does not have this problem...
We had some jerk on the channel that reguarly exploited this problem
to crash the node, so I fixed it. Both the packet length is limited
(not to a fixed low value of course, but depending on the MRU/MTU selected
for the interface) and the transmit queue has soft and hard limits.

But the SCC driver in NOS was derived from an earlier version, that one
still happily expands the mbuf as required.

>> (but the same is true for transmit frames. you can easily crash many NOS

Of course one uses UI frames.

I'm puzzled on how you are going to create a packet radio system with only
two frequencies for access, where on hamradio we have needed some 12..20
frequencies to get any useful cell structure without excessive hidden
transmitter problems.

Who is going to introduce a radio service with only 5 channels anyways?
Is that meant to be a discouragement to any sensible person considering
to buy such a radio, or a first allocation that is to be extended as
demand shows?

>The only good thing I see about the new CB radio (MURS), is that
>you can now talk direct to the McDonalds clerk! It's a revolution!
>Course, how do you get rid of that pager stuff right next door...

This will mean you need technically sound equipment. Like 20 year old
2M rigs re-aligned to the new band. Not like "modern" 2M rigs that tune
from airband to vhf-high.

I'm amazed that someone would buy a transceiver, supply, antenna etc for
that band, all to have only 5 channels.

When that would be done here (it happened decades ago on CB), there would
very quickly be a "strong voice" to extend the number of channels. And
when that would not be granted, (part of) the community would allocate
these "extended channels" all by themselves.

In the seventies, before CB was legalized, a novice license was introduced
here to allow CB-type users to "step up" to licensed amateur radio.
It was introduced with a 2-year validity and a 6-channel limit on 2M.
The idea was that within those two years one would get a regular amateur
license.

Well, the 2-year limit was dropped before the first licenses expired
(hence the first issued licences are still being extended today) and
the 6-channel limit was the next to follow. The allowed band was first
extended to the primary FM part of the 2M band, and later to include
SSB and 70cm.

Later there was a "legalized CB" regulation where one could use 22 channels
on 27MHz with FM modulation and 0.5W output. It has been extended to
40 channels and 4W.

Dave,
I'd go with a TNC rather than a modem (Baycom etc.) as it is MUCH more versatile. There are lots of used ones around... The PK-88 is an very reliable unit that I am sure you can get for a decent price. Many have been in service for years.
The multi-mode TNCs (PK-232 etc) are nice but if you do ever get into the 'other' modes you'll want to buy a packet only TNC to monitor FM packet...
There is LOTS of packet shareware around for both MAC and PC. Even DOS based APRS! I use onbe that is built into my logging software... something to consider, a single package logging, packet, rig / antenna control software. There are some that will even run on a 386.
Happy hunting

> Steve! Long time, no banter.

Don't worry....Lennie's been keeping it "flamingly hot" here.

> I don't know. Things on FRS/GMRS have not been that bad.

Things have "not been that bad" because the average FRS radio is
just a toy you can buy at Wally-World, and Amatuer equipment that could
be made to operate here is too cost prohibitive to the John Q Citizen
that want a hobby type of radio. Also, $85 license fees and pay-for-
use repeaters pretty much discourage GMRS applicants.

The technical diffrences (power, external antennas) and cost
(Amateur HT's at under $150 and moviles about the same at 50 watts) and
no license will make all the difference.

I already am keenly aware of the gross abuses of the itinerant
channels in the 151MHz range. MURS will be NO different.

> The big
> problem with CB was the easy/cheap availability of high-power
> amplifiers.

No, the problem with Class D CB was the fact that the FCC did not
heed the warnings of the ARRL and others in 1958 and placed a radio
service that was intended for short range, low power operations on a
part of the radio spectrum where low power signals can propagate
hundreds, even thousands of miles with very low power and mediocre
antennas.

It was only bound to happen that those looking for a way around
Amateur Radio examinations would find thier way here. And once the
solar cycle opened 11 meters up and people suddenly found themselves
talking across the continent, the floodgates were opened.

The linear amplifies and higher gain antennas didn't come till
later.

> Also, the CB debacle occurred BEFORE the Internet. Most
> technical sociopaths have moved onto the Internet, where they can

50 square mile area.

This is partly true, but if the Internet has siphoned off
these "sociopaths", then why is 11 meters still the cacophony of fouled-
mouthed RF that it is?

Trust me, it won't be long before this type activity gravitates to
this new service. All it will take is two guys arguing over "who (was)
there first"

This is codified into law. Amatuer Radio was MEANT from the "git-
go" as a NON-COMMERCIAL radio service. It was neer intended to further
business needs.

> 4) Frequency blow-hards. Transmitting with exessive power, these guys
> would dominate frequencies, and eliminate implementation of more
> efficient cellular-type Internet-backboned systems.

Unfortunately, EVERY radio service has these idiots. Luckily they
are less prolific on Amateur Radio because they at least have the
spectre of enforcement hanging over them.

The unadulterated BS that occurs on 11 meters does so because
there is little, if any, likelyhood of enforcement. In the early days
of CB, we all stuck right to the clock on 5 minute times, use of
callsigns and no profanity, etc. Once the FCC clearly couldn't or
wouldn't enforce CB regulations, the gloves came off.

Too bad. It was fun while it lasted.

> here as well vs. the Amateur service.

Stewart, WHAT makes you think that if people are going to be
lawless on 11 meters, that they will behave above 11 meters?

> I've been working on a national Internet-backboned MURS packet radio
> system for portable applications for a number of months now. Despite
> what the old PBBS-cronies say, most of the obviously "non-business
> oriented" applications should be usable. I.e., stock quotes are
> obviously out. However, ordering a pizza on digital should be treated
> the same as ordering a pizza on voice - so THAT will be OK ;^)

This would be an interesting concept, and one that SHOULD have
been applied to GMRS and it's interstitial frequencies.

I recently did some research on GMRS licenses, and intentionally
chose the most populated states of California, New York, Florida and
Ohio for my numbers.

California has the most GMRS licensees by far, but even at that,
there are only about 420 distictive licensees. Several licensees hold
multiple callsigns, therefore I counted ONLY the applicant, NOT the
number of callsigns held. Many of these licensees were authorized on
more than one pair.

Allowing for 10 "units" per licensee, that's only 4200 potential
users at any one time in a state of (?) 25 million people? That
further breaks down to about 600 users per repeater pair (assuming that
each licensee is using a repeater), however each pair may be re-used
due to geographical restrictions that I am sure you acknowledge at 70cm.

Ohio only had 35 licensees. Spread out over 7 pairs, that is 50
users per pair. Again allowing for re-use of a pair due to

geographical separation, that number becomes even MORE diluted. This is HARDLY good spectrum management.

The real "kicker" to this is that many of the users are REACT organizations, and they pretty much congregate on ONE particulare GMRS pair. (462/467.675).

What am I getting at? We already have the spectrum in place for EXACTLY the kind of service that the proponents of MURS are trying to create. Except the ACTUAL purpose of MURS is NOT spectrum planning...it is SELLING RADIOS!

If the FCC were to drop the GMRS license fees to a reasonable $10-$25 dollars per 10 year license and ammend Part 95 to allow the use of the interstital frequencies for the data/telemetery/etc functions proposed, the radio manufacturers wouldn't be able to keep them on the shelf. Repeaters would proliferate, data could move simultaneously with voice traffic, and we wouldn't be facing the likelyhood that we (Amateurs) will be faced with bootlegging of Amatuer gear on business and Public Safty frequencies.

Adios

Steve.

It's not the people who might populate MURS for it's intended use,
Rob. It will be those who "wink wink...don't cut this wire..." buy
these radios to use the "channels" outside of MURS.

> In the seventies, before CB was legalized,

It was "legal" in the US since the 50's, but deregulated in the
late 70's/early 80's. I do not recall the exact timeframe that the FCC
washed thier hands of it.

The MURS system as it is now will be a US only service. The rest
of your post was obviously not relative to US Novice licenses as the
data concerning license terms, allocations and authorized modes was all
erroneous as it pertains to the United States Novice.

This is of course not true. A TNC limits the versatility that a bare
modem has: a modem can send and receive anything the PC is programmed for.

A TNC can sometimes be convenient because the software you want to use
assumes one, but usually it will just be a drag. It has parameters that
can be set wrongly, and operation modes that it will drop out of when you
least expect it.

>There are lots of used ones around... The PK-88 is an very

Ouch... don't want to think about the energy that has been wasted over
that period of time!

If you want to go for a TNC, at least use a full-CMOS version, not those
NMOS tea-warmers.

You should be able to pick up a used KPC3 or PK12 for a good price. I
wouldn't get the PK88 as it does not have the newer features of the other
two that you may want to have as you get more into packet. IMHO

Hi Rob,

Well, you WERE discussing MURS which is a US service. I only
caught on to the "not US" when I read further into your post then
checked your domain. To be truthful, I missed your call in the trailer
at the end.

I apologize for the confusion.

For the average ham, using the average PC, with the average Windows
installation on it, using a TNC can save an awful lot of hair tearing!

The simple fact is that, in a multi-tasking environment, other hardware
devices can, and do, interfere with devices like Baycom modems that
generate a large number of hardware interrupts and require a low and
consistent interrupt servicing latency.

The use of Baycom modems has, if anything, contributed to the demise of
packet, simply because they are responsible for so many terrible quality
signals, and so many relatively deaf systems. (However, the use of sound
card modems seems to have pushed "deafness" into a whole new era!)

Yes, I know Baycom modems work fine on a 286 running DOS, but that's no
longer representative of the average shack PC. (Cue for someone to pop
up and tell us how wonderful Linux is? ;-)

Given the low cost of a second-hand TNC, for a beginner it has to be the
best way to get started on packet.

I'm not sure if this was urban legend or not, but supposedly FRS
resulted from some heavy lobbying activity by R/S to create a new market
for radios.

Yup! IMHO the preferred rigs to use are going to be those cheap (new/used)
Ham 2m rigs. Why? That's not hard to figure out, 5 watt HTs and 50 watt
mobile rigs, both with adjustable power settings, and they are TOO easy to
modify for out of band operation with a simple wire cut or chip diode
removal. When the "legal" MURS channels are too filled up, intentionally
jammed, taken over by channel control freaks, etc., they will drop down to
the civilized Ham 2m band.

Its bad enough that we have pirate 11m operators on 10m, now we are going to
have pirate MURS operators on 2m. Just wait until they discover they can
talk all over a large city using the installed base of 2m repeaters, you
will never be able to get rid of them permanently then. You can cut an
antenna to work the low frequency MURS channels, and the high end of 2m
easy. Then there are all those cheap used Mirage 2m brick amplifiers, at the
same Hamfests the pirate 11m operators go to for 10m gear to buy to run on
11m, oops. Just think about that MURS operator using a modified 2m rig, and
a nice 300 watt Mirage 2m brick amp in the trunk. That's the same situation
we have now, with the 11m pirate using a modified 10m "export" rig, with a
300 watt HF amplifier in the trunk.

Why buy???
On my web page I have a working APRS program that uses the US Census bureau's on-line Tiger mapping service. Neat service. link to their cgi script with the center in lat/long and the desired resolution and it sends back a gif of the map.
Mine is minimum right now and needs to be expanded.
The really neat thing, at least to me, is it runs on both Windows, Linux/Unix and Mac.

Well I think Mac, haven't tried on it yet.

What causes this amazing bit of magic. It is written in Tcl/Tk!!!! A really neat scripting language available FREE from sources listed on my page for about EVERY popular OS... Also the source for it is available, so it isn't proprietary, like Java.
And since it is a scripting language, my program is distributed as source code.
Tcl/Tk is really easy to learn, plenty of good books to learn from. Take my code as the base and customize it to be what YOU want. Not have only what somebody else thought was the right thing.

Check it out....

We are in agreement(amazing!). Another benefit to using data on UHF
vs. VHF is that those inexpensive TEKK UHF data radios will work there
at 9600bps with low TxDelays, and are virtually plug and play.

On VHF, for plug-and-play, you are basically stuck at 1200bps. Even if
you do mod a commercial radio to bypass the varactor and discriminator,
in order to run at 9600bps, you still will have high TxDelays - so it
is not worth it!

It has been working out pretty well. We just need to be able to run
data on some of the UHF channels. I'll settle for 1 interstitial
GMRS/FRS channel.

You mean on a.a.r.p.? Egads. I dropped that newsgroup like a bad habit. Actually, it WAS a bad habit, nothing productive was being accomplished - except maybe for sunken Russian submarine raising theories ;^)

> use repeaters pretty much discourage GMRS applicants.

The thing is - why would an abuser worry about paying/getting a license anyway?

I find it odd that there hasn't been any problems. My theory is that it is too much trouble for the CB abusers(I'm not talking about all of them) to mess around with the high feedline losses that occur on UHF. You just can't go down to Radio Shack and use 75 feet of their crappy RG8 coax, and expect things to work the same that they did on 11m. Additionally, a good high-gain UHF antenna will cost about $150 - on 11m, you could string wire for the antenna! But I think the most important factor is the lack of cheap high-power amps, like the 11m twerps got their hands on.

> The technical diffrences (power, external antennas) and cost
> (Amateur HT's at under $150 and moviles about the same at 50 watts) and
> no license will make all the difference.

I hope not - but you are probably right. Feedline losses aren't that excessive on VHF, and 50W IS enough to bother a lot of people - especially through a good high-gain antenna. But the lack of cheap

antennas might be the saving factor - the jerks won't be able to afford a good enough high-gain antenna to make 50W obnoxious enough to enough people. Besides - they already have "invested" in their 11m equipment - and are "set in their ways" on 11m.

> I already am keenly aware of the gross abuses of the itinerant
> channels in the 151MHz range. MURS will be NO different.

That is scary. Then you are probably right. I just hope it won't be as bad as CB got(I haven't been on 11m since ~1987 - it was AWFUL back then). Maybe it will make VHF fox-hunting a popular sport again.

Is it correct English/American to use the term "software's" (or "softwares")
when discussing multiple programs? I always believed this is in error,
and typically written by French people writing English. "software", I
thought, is not a countable object about which you can talk in plural form.

But now that I see a person with an English callsign posting this, I am
wondering if that is really true...

I have to agree with the fellow in the QRZ article, though...it's
not so much of the impact that MURS may have on Amateur Radio's census.

It's going to be the impact of all those (now) bootlegged 2M rigs
that will be "opened" for MURS use. We (Amateur Radio) are already
suffering the burden of the FCC's mistake in that we can't simply
procure equipment for our use in some parts of the spectrum. WE are
the one's paying for the sins of the CBers who moved Amateur linears to
11 meters.

I can see the price of 2M rigs initally dropping with increased
sales, but then skyrocketing after the FCC mandate type acceptance and
very strcitly controlled "wideband" VHF gear.

The people that MURS will appeal to MAY be the types who would
have considered Amateur Radio if not for the exams, but the limitations
on the technical specs and the rapid proliferation of gear will quickly
fill those 5 channels.

I live 25 miles from any major metropolitan area (if you consider
Chattanooga THAT metropolitan!), yet I can monitor a fair bit of FRS

traffic. I can imagine what the MURS channels will be like after they find out how to put an external antenna and a Mirage amp on them....

Here we go with another CB fiasco.

And your suggestions along with $2.00 will get you a cheap cup of
coffee at Starbucks. The "non-radio-savvy" general population is going
to thumb thier nose at that faster than you can say "What's yer 20,
Good Buddy...?!?!?!"

Channel 9 on CB is supposedly reserved for EMERGENCIES and
traveller assitiance ONLY. That's LAW. What do you think 99.99% of
the MURS users will say to your "suggestions"...???

That other .01% will finally figure out that MURS is not going
to "deliver" for them, and move on to the Amateur licenses that they
were trying to avoid in the first place. Only they will have spent
money on useless radios that they SHOULD have or COULD have spent on an
Amateur ticket and avoided all that silliness in the first place.

Steve! Long time, no banter.

Anyway, you have a point. However, we should at least try to see if we
can't make this thing work out. I'm hoping it can - in fact I've been
kinda "banking" on it.

> Channel 9 on CB is supposedly reserved for EMERGENCIES and
> traveller assitiance ONLY. That's LAW. What do you think 99.99% of
> the MURS users will say to your "suggestions"...???

I don't know. Things on FRS/GMRS have not been that bad. The big
problem with CB was the easy/cheap availability of high-power
amplifiers. Also, the CB debacle occurred BEFORE the Internet. Most
technical sociopaths have moved onto the Internet, where they can
harass a much larger population than a folks on 40 channels in their 50
square mile area.

> That other .01% will finally figure out that MURS is not going
> to "deliver" for them, and move on to the Amateur licenses that they
> were trying to avoid in the first place. Only they will have spent
> money on useless radios that they SHOULD have or COULD have spent on
an
> Amateur ticket and avoided all that silliness in the first place.

The problem with amateur is not just the license "restriction". The
problem can be summed up in two words - The Internet.

The reason why amateur packet died was basically four-fold. In order
of importance, these factors were:

1) Speed. Once folks could hook up to the Internet at 14.4Kbps, and it
became clear that Hams couldn't muster building a 9k6 network - it was

pretty much all over for ham packet radio. Now that we have Cable Modems and DSL connections - this problem is worse(except for certain applications - which I'll touch on in a moment).

2) Applications. Most of the applications that people want to use are TCP/IP-based; For desktop applications, most are not unusable at 1200bps. The exception has been APRS - which is really a combination of mobile and desktop applications.

3) Business-oriented communication restriction. Can't get stock quotes! Also, the PBBS-cronies feel that digital data is somehow "special", and should be treated "differently" than voice data. So they set up a system where they could play "God" and exercise "control freak" ideas. I.e., they could "edit" content to make sure that the pro-code voices would be dominant ;^0 They also feel that using the Internet is "cheating". Oh well.

4) Frequency blow-hards. Transmitting with exessive power, these guys would dominate frequencies, and eliminate implementation of more efficient cellular-type Internet-backboned systems.

So, you will ask, why should things be any different now? Well, the explanation for why problems 1) and 2) are no longer so significant can be summed up in 2 words - mobile applications. PDAs are now much more powerful than they used to be, and character-based applications work fairly well with them at 1200bps (e-mail, newsgroups, chat, stock quotes, etc.). As for problem 3), well that just isn't a problem anymore with MURS - sorry all you control freaks out there! And problem 4)? well, with a 2w ERP restriction, we should get some relief here as well vs. the Amateur service.

I've been working on a national Internet-backboned MURS packet radio system for portable applications for a number of months now. Despite what the old PBBS-cronies say, most of the obviously "non-business oriented" applications should be usable. I.e., stock quotes are obviously out. However, ordering a pizza on digital should be treated the same as ordering a pizza on voice - so THAT will be OK ;^)

True for all versions of NOS where I've had access to sources.
SNOS won't do this, it has some "this makes no sense so drop
the frame(s)" heuristics, as well as some "hmm, buffers getting
tight, so lets toss some stuff and let the protcol retry" heuristics.

> (but the same is true for transmit frames. you can easily crash many NOS
> systems by sending a long series of large PING messages on a halfduplex

> after some time they will run out of memory)

Possible with UI frames. With I frames, the versions of NOS I know
about will ignore anything outside the current window, so there is a
gauranteed max buffer pool required (which can be pre-allocated),
and incoming frames outside the window are tossed.

Certainly possible over ethernet, but that doesn't apply to ham
radio transmissions (smile).

We lost the folks who were not interested in radio.
Building a 9k6 network became pretty much trivial ten years ago.
Sorry you have been off air so long.

Many tcp/ip applications work well at 1200, and many more work well at 9k6.
APRS is not a tcp/ip application.
You are *really* out of touch with ham radio!

> 3) Business-oriented communication restriction. Can't get stock
> quotes!

Straw man. Can't do busines over ham radio. Duh ...

> Also, the PBBS-cronies feel that digital data is
> somehow "special", and should be treated "differently" than voice

Digital *is* treated differently in the regulations.
Perhaps you might read them some time to understand how, and why.

> So they set up a system where they could play "God" and
> exercise "control freak" ideas. I.e., they could "edit" content to

I guess you have no clue at all how the store and forward
network works. Nobody can "control" what traffic moves
around the network. There are no choke points. Anyone
can set up a system and bypass any "control freak".
In fact that is what always happens ... it's trivial to do.
It is an open network. Was designed that way from the start.

> make sure that the pro-code voices would be dominant ;^0 They also
> feel that using the Internet is "cheating". Oh well.

I personally prefer ASCII to BAUDOT, but 16 bit codes work fine also.

> 4) Frequency blow-hards. Transmitting with exessive power, these guys

Low and consistent interrupt servicing latency has little or nothing to
do with multi-tasking. On any multi-tasking system it should be possible
to write a device driver that includes an interrupt service routine which
is quickly being called when a hardware interrupt comes in. It should
not be necessary to do a process context switch for that, and so it does
not matter if the system is single- or multi tasking.

There will be a user process that hands over data in managable chunks
(packets, in this case) to a device driver, which in this case will send
the data bit-by-bit as driven by the interrupt handler. The user process
is not involved in that.

Now of course we all know that Windows does not really shine when low
interrupt servicing latency is concerned. But that is because of the
fanatic attempts at backward compatability with 16-bit mode, not because of
multi-tasking! The mode switches disable interrupts for a long time, and
the overhead of 16-bit interrupt handlers being called while in 32-bit mode
(and the reverse) is high.

This explains why it works much better in Linux, but also in Windows NT.

The problem with Baycom modems in Windows does not necessarily result
from context switching. The problem arises because other device drivers,
in particular video card drivers, will disable interrupts for too long.
Also PCI busmastering can cause problems. Even when the Baycom driver is
running in ring 0, it is not protected from other badly behaved drivers
also running in ring 0.

>There will be a user process that hands over data in managable chunks
>(packets, in this case) to a device driver, which in this case will send

>is not involved in that.

I don't really follow that, at least not in relation to a Baycom modem,
because the interrupt latency problem that occurs has nothing to do with
handing over chunks of data. The problems occur at driver level.
Incoming data is received as a bit stream, and there is a clock (usually
generated via the UART THRE interrupt) also running at bit rate. So

that's around 2k time-critical interrupts a second. It obviously doesn't need much to get in the way to result in a bit being lost or misinterpreted.

Whew, didn't think I'd ruff up any feathers, guess we are passionate about our packet.

I still say you are going to have trouble with a "Baycom" type modem if you want to run it from a logging program, APRS software or connect it to a GPS!!! Nothing to do with all that internal system stuff... its a matter of software / hardware compatability!

At a "home' station a few watts up in heat is meaningless.... Sure low power consumption is needed for portable work. But I don't think that was mentioned in the original post. The heat generated by my 50 amp power supplies and linear makes the 88's loss meaningless (come on, it barely keeps my coffe cup warm, the linear does a MUCH better job (Hi))!!! And my point was that it has been operating for years and has never faltered.... and there are LOTs of them out there!

Yes there are 'better' TNCs out there (jeese the 88 is an ancient design) but, for simple V/UHF packet / BBS / DXCluster the 88 will work just fine.

Nice to see differing views, makes the world an interesting place?

I think it's like sheep.
One sheep, two sheep, a herd of sheep, we have all heard of sheep.
English tends to lose number and gender quite often ... forgetting
it's roots in OF, ME, et al.

But there is "warez" ... presumably from "wares" meaning things
for sale via a reversal (like cleave to and cleave asunder) and
the similarity to "software".

If you're only going to "talk to yourself", then you'll need two
radios, two TNCs, and two antennas.

You only need a "data radio" if you are going to go faster than
1200bps. At 1200bps, you can pretty much just use any old voice
radio. Some are better than others, of course.

Also, if you are going to want to go faster than 1200bps, the cost of
the TNCs will at least double.

What I don't understand is why the radio manufacturers would propose
a band which would only accomodate 5 channels. I would think that any
prospective buyer of such a radio would immedeately think "5 channels,
that is only an extremely limited number to choose from. I will probably
have interference from other users of this system".
This would (or should) hold off most buyers from investing a considerable
amount of money in such a radio, and thus would conflict with the goals
of the manufacturers.

The fact that potential for interference from other services exists only
makes matters worse.

No, but if the turtles migrate to California and jam my 2.4GHz repeater input,
their radios will be confiscated.

Since higher frequencies generally require higher power (over time), the lower
frequency transmitters are probably a better choice. You might want to even
try something in the 70cm band.

I have a problem with correct Lon/Lat co-ords being displayed properly.
After playing EMail tag with the Author 3 times, and still not having a clue
how to fix it, I thought I'd post here.

The coordinates Appear to be displayed in the OSGB-36 Datum, which is ok for
Europe, but for them to be correct in North America, I need it to be in the
WGS-84 Datum.

My home CORRECT COORDINATES Are:

43 34'32"N
80 15'19"W

But UI-VIEW Displayes it as:

43 34'54"N
80 15'33"W

Roughly off by Half a Mile. Can anyone point me in the right direction to
fix this? I'd appreciate it. I know it's not a setting on the TNC, or the
GPS, as it works perfectly through www.aprs.net and through WinAPRS.

TIA

Source record: 10356

It's not a datum problem, it's grade school math:

UI-View uses minutes. It has no concept of seconds. Most
navigators use minutes, and seconds are pretty much obsolete.

Your Home coordinates in minutes is:

43.34.53N 080.15.32W

Put that into your UI-View "station setup" window. The .54 and .33
values you show are not precise, and over-rounded.

.33 minutes is 19.8 seconds (.33 * 60)
.54 minutes is 32.4 seconds (.54 * 60)

You can see this is .8 seconds farther west, and .4 seconds
farther north than your stated position.

If that doesn't correct the problem, then walk the icon onto the
right position (the map may be poorly aligned) by adjusting the
values.

4465. Pc PakRatt for DOS source code for sale from CSS

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-10-20 00:00:00 UTC
From: Rick Ruhl <ricker@cssincorp.com>
Message-ID: <Gq8I5.24274$Ou2.1325997@news-east.usenetserver.com>
Source record: 10357
Cross-posted to: alt.ham-radio.packet,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

Many of you know that back in March of 1999, CSS purchased the rights to the Pc PakRatt for DOS and Windows source code. We made some enhancements to the Windows version, but since Timewave had discontinued the DOS Pakratt product, we didn't put any resources into upgrading it with the Y2K fixes.

Since that time, we've received requests to update the DOS version. Since the focus of CSS is Windows software and we know many of you still prefer DOS, we are offering the source code up for sale. We feel this is the right thing to do, since many of you continue to use the older computers for your TNC and logging programs.

We'd like the new owner or owner group to have experience in C and assembly, as this is what PakRatt for DOS is written in. It does compile with MASM 5.1 and Microsoft C++ 8.0 (the Visual C++ compiler).

Once you purchase the source, you can do anything you want with it, except call it PcPakratt or 'The former PcPakratt'. PakRatt is a Trademark of Timewave Technology and we cannot sell the name to you, just the source for the program.

Serious bids only and serious coders only.

Rick Ruhl - W4PC
President, Creative Services Software, Inc.

In article <slrn8uqlau.16v.nomail@linux.pe1chl.ampr.org>,

> Who is going to introduce a radio service with only 5 channels anyways? Is that meant to be a discouragement to any sensible person considering to buy such a radio, or a first allocation that is to be extended as demand shows?<

I think you need to understand how the Rule Making process works here, Rob.

A petitioner approaches the FCC, in this case commecial entities looking to sell radios, and makes a proposal for certain services. The FCC looks to see if the proposal can be accomodated under present regulations, then either dismisses it as moot, or assigns it an NPRM, or "Notice of Proposed Rule Making" number.

This NPRM is then published in the Federal Register and the citizens are allowed to comment on the matter. After the initial Comment period, there is a "Reply Comments" period, after which the FCC then takes the matter for action.

In this case there was a proposal by manufaturers to create a new radio service on certain discreet VHF channels with the aforementioned purposes.

Never mind that there has been no public demand for this service. Present cellular services here in the US alread offer almost all of the services proposed by MURS, and what ISN'T covered by MURS is either accomodated by the General Mobile Radio Service (a UHF voice service at 462/467 MHz), FRS, ot the itinerant business channels.

This was nothing more than a ploy to sell more radios. The channels that MURS will occupy are inbetween former police channels (now on 800MHz). Unfortunately, the prosposed service will ALSO be near channels STILL used by Public Service users in less affluent areas and other business and wireless users (ie: pagers)

Not all areas of the US find it necessary to move to UHF/Trunked systems. The area I live in is rural, and outr local PD and Sheriff are still on VHF and have no immediate plans to move. Why should they?

However the proliferation of these types of radios (MURS) and the almost certain "sprawl" it will create to adjacent channels will make it almost mandatory for such agencies to spends tens of thousands of dollars to change systems due to interference.

There is nothing new or innovative about the services MURS proposes to provide. It was simply an aggressive commercial market that managed to manipulate the NPRM process favorably and now we are going to have to do some quick tap dancing to stop it before it can manifest.

The intent is an interesting one, but other resources already exist that can better fill this need and withn only changes to existing regulations, not creation of new ones.

Yes you do. UI-View uses bitmap/raster maps, which don't zoom very well,
so UI-View won't do it. WinAPRS etc are usually used with vector maps,
which of course scale very well, but are typically not as nice to look at.

Hey Folks,

I am think of developing a system for radio telemetry of small animals - turtles in this case - and was looking for suggestions. We have been using small vhf transmitters that run off a couple of watch batteries. These are commercially available and very expensive, not to mention bulky and short on range.

I would like to put together a small transmitter that will run for several months off a watch battery, preferably at 900mhz or 2.4 ghz. This will allow me to track the turtles with greater precision (because I can use a more directional antenna). These turtles hang out in swamps filled with poisonous snakes and alligators so being able to localize from a high spot several hundred meters away would also be a plus!

There seems to be a number of chips available these days - byproducts of the cell phone and portable home phone industries. I was wondering if anyone out there has played with any of them?

Thanks.

Hi there,
While cleaning out the shack I found a PacketMac kit from around
1993. It's 90% unbuilt.

This is a baycom like modem for the Macintosh.

Any one interested?

I'd rather not ship it but will if someone pays shipping.

I'm in San Francisco.

I think you have the display set for Decimal Minutes instead of Seconds
(DD,MM.MM instead of DD,MM,SS.) If you multiply the last two fractional digits
".54" times 60 you get ~ 32 seconds.

I will make it $20 if you throw in the C compiler and the Masm compiler, I junked my dos compilers years ago.

Seriously though, why not do the right thing and put the source code in the public domain, dos is dead, even the source code is pretty useless, nobody drives com ports that way anymore...

Do you think a transmitter that will run for several months off a watch
battery will be very successfull at jamming your 2.4GHz repeater input??

OK, I see you on the map with a GPS. So your coordinates are
GPS derived. I see UI-View echoes the exact coordinates of your
GPS. So if your icon is off by 1/2 mile, then the answer can only
be, that your map coordinates (top left/bottom right) are defective.

What is the source of your map? Maybe that map doesn't use
WGS datum? Which I suspect, and the reason why winaprs would
seem to work.

"Disposable Hero" says:

>After playing EMail tag with the Author 3 times, and still not having a clue
>how to fix it, I thought I'd post here.
Etc...

As "the Author", here's the original explanation I gave:-

****
UI-View, like all APRS software, uses degrees.minutes.decimal_minutes
NOT seconds. You are obviously thinking it is seconds.

If you open the Station Setup dialogue, and press F1 for help, you will
see -

Latitude - input your station latitude. The format is dd.mm.nn<NS>. "dd"
is two digits for degrees. "mm" is two digits for minutes. "nn" is two
digits for decimal minutes. NOTE - decimal minutes, not seconds. "<NS"
is either "N" for North or "S for South. Example - 52.58.23N

Longitude - input your station longitude. The format is ddd.mm.nn<EW>.
"ddd" is three digits for degrees. "mm" is two digits for minutes. "nn"
is two digits for decimal minutes. NOTE - decimal minutes, not seconds.
"<EW>" is either "E" for East or "W" for West. Example - 000.02.77W
****

I don't think there's much I can add to that other than to say that
UI-View is consistent in its use of decimal degrees, it never uses
seconds. What's the point of using seconds in the software when it's not
what APRS uses? However, I do realise that some other APRS software uses
seconds for inputting your position, even though it's not what is
transmitted.

From: ac267@freenet.hamilton.on.ca
Message-ID: <8ssnb3esp1@mohawk.hwcn.org>
Source record: 10369

Having recently acquired a pk96 tnc modem, I'm having trouble with
implementation. To wit, while it is chatting to the comupter, sort of, in
loopback test mode (DIN connectors 1 & 4 closed), the text is garbled. I
don't have a null modem cable, do have the com port parameters set to what
the book says, and on. This occurs even just shorting the receptacle
itself, though I certainly get the same pattern with the cable I put
together. Any thoughts on what the problem may be? I am going to a DB9
from the original DB23, but didn't think this would cause trouble.
Anyhoo, thanks for any assitance...

1) That was obviously a joke.
2) Some of my neighbors' 2.4GHz cordless phones, even the ones 5 miles away,
are quite good at jamming the input.

What kind of cordless phones are on 2.4GHz in the USA?
In Europe, we have DECT phones (a digital system, time-division
multiplexing on a couple of channels on 1.88GHz), but they are extremely
low power and the range is only 100m or so.

I've got a Panasonic cordless on 2.4Ghz, and it has a range of at least
100m or so - to the end of my yard. Perhaps more, but I've never tried it.

Tim,

You are asking for divergent features. If you want longer range, then you have shorter battery life. If you want smaller, then you get more expensive. The cellphone and wireless phone industries probably won't be of much advantage to you, they really don't go after the really long life scenarios. For them, 8 hours of talk time is a lot, and that's done with a battery that's significantly larger than a watch battery.

About the only thing that I can think of is to implement a device with an extremely long sleep period that wakes up a receiver periodically (once an hour?) to see if a pilot transmitter (you) is in range. At that point it can go into a high power mode until you find it or it loses the pilot.

But still, anytime that you are transmitting, you are using a lot of power. A 50mW signal just isn't going to be heard from far away and is going to put a pretty good load on a battery.

The alternative is to follow the cellular solution and put up a lot of listening posts in the swamps.

Who knows what they paid...? When it was a reasonable, small amount they
would probably put it in the public domain themselves... it very much
looks like a desparate last attempt to recover some of the money spent on a
program nobody is interested to maintain anymore.

The "range may be limited" but the sensitivity of the system is also in excess of +20dB of receiver stage gain before going into a 0.16 microvolt sensitive receiver. The radios that are made for this band only put out 1W at "high" power. Do the math - what kind of sensitivity do I need to have a 25 mile (or 40km) coverage range? I did. That's pretty much going to pull in nearby, "weak" transmitters too.

Rob et all:

There is no desperation here at all. CSS is a no-debt software company and has been in business 12 years. If we don't sell it, we stay in business as we are doing now. It's just the DOS version doesn't get any work done on it.

What I am trying to do is allow some ham or group of hams an opportunity to support the DOS product and possible make some extra money for THEM since WE are focused on Windows.

We had discussed putting it into the public domain or with a GNU license but decided that the resources on supporting it would take away from our Windows products.

Fact: There are 80,000 Pk-232 that were sold by AEA
Fact: Each one of them had PcPakratt lite included.
Fact: Each version of PcPakRatt lite and PcPakRatt II has Y2K issues

So if just 1% of the hams who own PK-232s bought a $25 upgrade of PakRatt DOS, that's 800 units of sales for revenue of $20,000. If 2% bought the upgrade from a ham, that's $40,000 of revenue. From the information I have, I believe about 10%-20% of hams that have computers still run under DOS and are happy with that.

I'm looking for around $5,000+ for the source code.. I believe AEA invested about $100,000 in the development process. This does include the source for PakRatt Lite, PakRatt II for DOS and the PK-270 commercial version of the DOS software.

And there is market potential for 1 or 2 future upgrades for the DOS version, but we want to focus on Windows, not DOS.

There is one problem with these best case "off the cuff" figures.

AX.25 packet is dead. It is dying so fast, no one knows what
to do, product wise. Here locally there is one node, one frequency
remaining, and I can't find anything on HF packet except BBS
diehards.

Visual Basic and Java, are the two programming languages of
the PC that are doing well. C is fading fast, and Object Oriented
languages are the programming style of choice today. C++ had a
beginning surge, but Java has pushed it from the scene.

The big mode today is the PSK31 and modes that use the soundcard
on HF. This is even becoming popular on VHF with all-mode rigs.

So the whole concept of AX.25 is a bad investment strategy for all
older DOS C software, in my opinion.

But let's take the figures...

You may very well make 20k the first year, and all will be well,
but you also have to factor in the post-purchase costs. Say you set up
an online web page to sell the software as downloaded credit card
purchases. You don't want to have to ship this stuff (floppy and manual
costs). Figure ISDN speed as a minimum, and that will run you about
$300 a month. Then the credit card online store gets 10% of sales, now
we're down to $18k. Given the internet connection for one year ($3600)
that leaves you with $10 k, or about $5 an hour income for the year.
Then there's taxes, figure 33% or $6600, and now you're left with $3400
or about $1.63 an hour. So you are going to need two years to show
a profit. If there is only one node on one frequency today, how many will
there be a year from now.

And no, you can't legally use your cable-modem for distribution.

I think there may be a case for liquidating the software. Just put a GNU
sticker on it, and upload it to a Linux distribution site. Zero cost, and
you
are done with it. You can even claim a tax credit.

Dean.

The source code supports the multimode protocols in the PK-232, not just the AX25 packet side.

So it does CW, RTTY, ASCII, FEC, Pactor, etc... anything that the TNC supports..

And someone could add PSK-31 DOS support it it, by using soundcard code and using the TNC or TNCs serial port for the keying circut, like we're doing with the next release of Pacterm and PkTerm. It would also be good for a dos based contest or logging program that wants to add host mode TNC support to it for the PK-232.

My real name is Gabrielle, K6CAT. I'm currently playing in the
all nude Dean Martin retrospective show in Vegas. Tell the waiter
you would like to see "Gabby the Cat"! I'm also on the can-can net
at 4am when we travel back to LA on the bus.

But I disagree. There hasn't been a valid discussion on here in 5 years,
and my callsign is not going to help.

Also - that program could support the PK-900 with a little tinkering.....and
additions here and there....
ACARS is also supported by the PK-900, and that should be considered in the
next version of whatever software can be redone......

probably have interference from other users of this system".

You or I would think that, Rob, because we have an appreciation of
how the different radio services all dovetail together.

The non-technical radio operator hasn't got a clue as to why they
are "getting stepped on".

Even worse in the United States is the "Part 15" warning on all
sorts of "consumer electronics".

The FCC requires that any type of non-licensed RF device (cordless
telephones, stereos, televisons, computers, etc) have a "warning" on
them to alert the consumer to the fact that the device in question MAY
experience some sort of interference, but (to put it bluntly), "too
bad".

Despite this caveat, there have been tens of thousands of
complaints filed by consumers with the FCC about interference from
everything from CB and Ham radio emitters to broadcast despite the fact
that the "offending" emitter was operating according to thier specific
regulations.

The manufacturers almost depend on this. They get consumers to
buy "less than optimum" devices, then once they have gotten a taste of
the service, they will now buy either far more expensive devices to get
rid of the interference, or thye go looking for some other (read that
equally more expensive) alternatives.

Some racket, huh...?!?!

> This would (or should) hold off most buyers from investing a
considerable amount of money in such a radio, and thus would conflict
with the goals of the manufacturers.

As you can see above, it doesn't "conflict" with thier goals, it
is a part of the marketing strategy!

> The fact that potential for interference from other services exists only makes matters worse.

Yep. And unfortunately history shows that radio spectrum left unattended by regulatory enforcement is abused to the point of uselessness.

0.16 uV into 50 ohms is about -123 dBm and assuming NBFM bandwidths
and even a totally noise free 20 dB preamp will not improve the
sensitivity much, due to the thermal noise of the surrounding ground
at 300 K (or about -174 dBm/Hz noise density).

>The radios that are made for this band only put out 1W at "high"
>power. Do the math - what kind of sensitivity do I need to have a 25 mile (or
>40km) coverage range? I did.

While only a few mW of radiated power is required to get into a -123
dBm receiver at this distance, this would require a true line of sight
path with at least the first Fresnel zone free of any obstacles.

>That's pretty much going to pull in nearby,
>"weak" transmitters too.

The thread started about tracking turtles in a swamp, it is quite
unlikely that there are going to be clean line of sight path to the
repeater receiver antenna. While the signal may bounce nicely around
in urban areas, I do not see how you would get any measurable signals
out of the swamp, with very little reflecting surfaces and vegetation
absorbing the direct radiation.

If the PK-900 properly supports the decoding of ACARS, then surely it
should display it in any terminal program, why should it need a host
mode program?

>we are doing now. It's just the DOS version doesn't get any work done on it.

I'm not suggesting your company desperately needs the money, I just think
you are desparately trying to recover some of the money spent on a dying
system.

>What I am trying to do is allow some ham or group of hams an opportunity to
>support the DOS product and possible make some extra money for THEM since WE
>are focused on Windows.

If that is what you really want, then you should give the sources to
someone at little or no charge, and sign a contract covering the price at
which upgrades are to be sold and the fraction of that amount that is to go
to CSS (maybe up to a maximum).
Then the risk stays with you, and you still allow someone to make money and
get your fair share of it.

>We had discussed putting it into the public domain or with a GNU license but
>decided that the resources on supporting it would take away from our Windows
>products.

When you put it on a server, with a GNU license and a clear indication that
you are not going to do further support, you will need no further resources
to support it. There even are special websites for "orphaned software" to
do exactly that. Others can then take up the opportunity to step in as a
new maintainer/coordinator.

>Fact: There are 80,000 Pk-232 that were sold by AEA
>Fact: Each one of them had PcPakratt lite included.
>Fact: Each version of PcPakRatt lite and PcPakRatt II has Y2K issues

Fact: Y2K has now been underway for some 300 days.
Probably most users of non-Y2K-aware programs by now have realized that
something needs to change, and when the original distributor if the program
does not release an upgrade, the option is to change to another program.
If Y2K issues were a motivation to buy an upgrade, you are at least a year
too late with this move. The "impulse" Y2K upgrade buyers are now all
gone. The Y2K patch should have been available, or at least announced,
at the time the problem occurred.

AGWPE supports using the sound card as a modem, and UI-View supports
AGWPE, so it's perfectly possible to do it.

(Anyone who is about to reply and say that they can't get the sound card
modem to work in AGWPE should first try the latest version.)

Or how about mounting an array of solar cells on the turtles' backs to
recharge a small NiMH battery? You could mount one on each hex cell in
the turtle's shell.

I understand that there is a nice pond that you could use for testing
these 2.4Ghz "devices" on ROCHEDALE LN in Los Angeles.

Someone posted information on this just last week:

****

Poor Man's Packet and other Baycom-like devices are not
TNCs. They are modems, with the protocol processing done in
software. Modern implementations do all the processing in
software.

The TCM3105 modem chip these designs used is long obsolete
and unavailable in surplus. MX614 is a replacement, albeit
not a drop-in one.

Laura Halliday VE7LDH "Que les nuages soient notre

****

> With greetings SQ9ETF Slawek JO90PG
> sq9etf@kki.net.pl

People are working on PIC-based MX614 "devices"(myself included). I
believe the TAPR PIC-encoder comes with an MX614. The problem is that
the PIC-encoder's 16F84 chip apparently is too gutless to do both
transmit and receive synchronous encoding/decoding(so you can just use
your PC's/PDA's asynchronous serial port to send packets!) - and you
must use a more powerful PIC device?

Source record: 10252

Hi, currently we are getting newly licenced amateurs in our club and some of the older ones too showing an interest in packet radio..

Can someone point me in the right direction (URL etc), for the following..

A current day reeplacement for the baycom style project.. Cheaper the better?

Packet radio using a sound card? Also whats the slowest CPU this will work on?

Is there a project using a pic chip that will emulate a complete TNC. If so does it support Kiss?

Is there a pic project or similar that can go between a GPS NMEA port and a standard TNC like a Heath Kit HK-micro 21, to do APRS? I know newer TNC's support this, but we have a lot of older TNCs in the club. Some do not support the normal eprom upgrades.

Is the Pic - E project from Tampr a full TNC style device for normal 1k2 AFSK packet? Or is it just for APRS?

Also possibly a cheap pic based TNC for 9k6 G3RUH?

Please reply via my E-mail as I probably won't check this news group again in the near future..

Perhaps because the place to start is to help yourself. The issue
you raise is not a new one, and has been discussed - many times -
in this news group. As the most cursory search would show.

This is a *discussion* group: the information flows both ways.
If you want information back, perhaps you should contribute
something.

It is an insult to ask questions in a newsgroup and asking for replies by
mail. Why? Because a newsgroup is not a computer, but a group of people
that reply to your question after reading it.
You are telling them that you are interested in replies but do not want
to spend any effort to read them. Why would the group bother to make the
effort to write you a response?

Besides, a similar question was asked last week.

The following quote from a usenet FAQ might be of help to you:-

"If you do not read a newsgroup, you cannot know what the subject of the
newsgroup is, what the standards of behavior are, what the frequently
discussed topics are. Usenet does not exist to give you a free research
tool. It is also considered incredibly rude to post a question to a
newsgroup you do not read, and ask for replies in e-mail - by doing so,
you are telling the people you want to answer your question that their
issues are not important to you."

(The full document can be found at -
http://www.cs.ruu.nl/wais/html/na-dir/finding-groups/general.html)

It's because you put a criticism trigger in your article.

Normally when you ask a FAQ and nobody is interested in replying, things
will just remain quiet. But ask for replies via e-mail and you will get
flamed.

Don't think this is somehow unique to this group, it is a property of
Usenet.

Hi.

> Can you not buy these ROMs from heathkit?

I was lead to believe quiet some years back that Heath Kit do not exist anymore.

>Your not planning on Pirating
> them are you? Looks like it to me.

The only source for the Eproms that I have been told about is pacomm. Now if they've taken the original code, modified it to include GPS and then re sell it over and over again.. WHo's pirating?? Humm???

> Based on your other messages, you don't like paying for much.

You should try reading the messages a little better. I admit, in the case of the HK-21 aprox A$150 to get an eprom to upgrade the TNC is not very appealing!

I could buy a whole new TNC for that sort of money.

But, with regards to the other questions, I am doing research to help our local club get users on the air with packet cheaply. Now it's not I that is after cheap solutions for this. I have a number of TNC's here. PK232MBX, PK88's, HK21's. It is the general attitude of most amateurs wishing to enjoy their hobby as cheaply as possible.

Personally I can't see why anyone in their right mind would want to disagree with this?.. After all it is a hobby!

> Don't be so cheap.

I offer my time for free and my help for free to try and promote the hobbie locally and otherwise in worrying times like this where we are currently loosing bands through lack of use. ANd I get rubbish like this as a reply to questions that are designed to help increase Amateur radio activity.

How pitifull! :(

Try a more posative attitude in future.

Regards,
Ken.

Err, they paid for the rights to do this. And in fact, the original
unit was developed by Tasco (IIRC), and they did the upgrades and sold
the rights.

Well, the cheapest way to get this is to break into a ham radio store, and steal their stock. Or maybe steal from one of your other local hams.

Stealing software is not quite as bad, since you're not depriving the owner of the use of that software, but you are depriving them of some value.

Is this supposed to make sence?
Help myself? Actually I'm doing this to try and help others..

OK I'll bite. What are you trying to say or suggest by suggesting I need to
try and help myself?

> you raise is not a new one, and has been discussed - many times -

With something as large as the internet, and the amount of data that flows
through it every day, surely you don't expect that I read the complete
contents of every news group regularly.. ???

> in this news group. As the most cursory search would show.

Well I looked through the group before I posted, and saw nothing relatinng
to what I was asking.. Even so. What's the big deal. It wouldn't be the
first time a question has been asked more than once in a forum.

> This is a *discussion* group: the information flows both ways.
> If you want information back, perhaps you should contribute
> something.

Well, I have replied to a number of msgs in other forums regarding CDR
technology recently. And I would be happy to do similar if I read something
I can help with here..

What suprises me is that I put out some questions and all of a sudden I get
criticised..

Seems like a wasted resource if this is all it's good for?

I think in future I won't even take the time to respond to negative replies.

Regards,
Ken.

It is difficult to say what the 'right' thing to do is, but it is near-certain that the only way to prevent old programs (such as Pc PakRatt) from dying out is to Open-Source them.

Anything else will kill it. The profit is not there for commercial versions anymore.

Source record: 10272

A good example of the attitude too many hams have that turns people off. Seen it all my life as a amateur. The old "Go away kid, don't bother me I don't have time for you" routine.

BTW, Laura., you don't have to read the posts if you don't want to. Just skip to the next thread.

It is perfectly acceptable for someone to ask for a reply off-line. Some consider it polite. It's also alot easier to read email than it is news, especially if they are on the road. Try scanning thru 200+ Usenet posts with a wireless web cell phone. Email is much more efficient re. bandwidth.

Yes, a topic may have already been discussed but there are folks who may have a fresh insight or new information that might not have been covered previously. I would be interested in the latest info on Cheap TNC's myself.

Lurk mode on...

Cannot be done. You have to cut a part of the map with a photo processing
program, save it under a different name, and then setup .inf coordinates
for that partial map. You zoom to the section by selecting that different
map.

You need to make yourself some more detailed maps for the relevant area. For the USA you can easily make them from Street Atlas or Precision Mapping. There's a map grabbing utility for Street Atlas on my web site. It was designed to be used with the 32 bit version of UI-View, but it also works ok with the 16 bit version.

For general guidance on making UI-View maps, read the "UI-View Maps" section of the help.

Assuming you are still reading the newsgroup, I'm putting the information
here for *ALL* readers - not just the ones who can't be bothered to come
and read it.

You will find what you are looking for at our club website (URL in sig).

This has all the details of a 9k6 modem what will run on an SCC card, on
the disconnect header of a TNC or stand-alone on the serial port of a PC.
Drivers are available for DOS (BPQ, *NOS, Ethernet) Win95/8 (sv2agw) and
Linux.. All circuits, PCB layouts, CPU code, construction details, testing
methods - the lot.

In future, remember that this resource is Usenet first, radio (amateur,
unlicensed or otherwise) enthusiasts second, so keep to the accepted
practice of Usenet please.

4540. Soundcard vs TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-10-26 22:55:35 UTC
From: news31@my-deja.com
Message-ID: <8tacp6acr1@nnrp1.deja.com>
Source record: 10277

I have experimented with Flexnet software with the soundcard driver on DOS and it seems that the software somehow misses some of the packets, maybe 30%. The S-meter indicates that there is a strong packet transmission but the software doesn't display anything when monitoring. SOmeone suggested keeping the squelch open all the time but it didn't seem to help. While adjusting the audio signal level with SMDIAG utility I noticed it misses packets too. I wonder if this is specific to the soundcard software and if an external TNC would perform better ? Any experiences with the same software anyone ?

There is no zooming in UI-View. That's a line vector technique.
UI-View uses pictures, and zooming into a picture just results
in distortion.

I admit this is a little hard to get used to, but after a couple of
days the zoomed-in vector line maps seem quaint by comparison.

The first thing I would try is run a scope program, and let a station
transmit continuous flags.
Then judge the quality of the audio. There are some things that can go
wrong in the chain from receiver to digitized sound, and this method
allows you to see if it is OK.

(at least when you know what to look for...)

4543. PSK31 on 2m

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-10-27 12:38:06 UTC
From: Paul Wilton <Paul.Wilton@physics.org>
Message-ID: <39f97703_2@nnrp1.news.uk.psi.net>
Source record: 10281

Has PSK31 been used much on 2m SSB and does it work ok? One ham commented that there wasn't a lot of activiity because it is not matched to propagation on 2m. Is this true?

If there is some activity on 2m, what frequencies are used in Europe? In the UK, the recommended frequency is 144.085MHz +/-5kHz. However, I have seen very little activity there. Are there other common frequencies?

On a final note, does anyone in the UK/Europe within 200 miles of IO90HX wish to arrange a sked?

a measly $6!!

HOW TO TURN SIX DOLLARS INTO SIX THOUSAND:
READING THIS COULD CHANGE YOUR LIFE! Wow!!
IT DOES WORK!

A little while back, I was browsing through
newsgroups, just like you
are
now, and came across an article similar to
this that said you could make

thousands of dollars within weeks with only
an initial investment of
$6.00!
So I thought, "Yeah right, this must be a
scam", but like most of us, I
was
curious, so I kept reading. Anyway, it said
that you send $1.00 to each
of
the 6 names and address stated in the
article. You then place your own
name
and address in the bottom of the list at #6,
and post the article in at
least 200 newsgroups.
(There are thousands) No catch, that was it.
So after thinking it over,
and
talking to a few people first, I thought
about trying it. I figured:
"What
have I got to lose except 6 stamps and
$6.00, right?" Then I invested
the

measly $6.00. Well GUESS WHAT!?...Within 7
days, I started getting money
in
the mail! I was shocked! I figured it would
end soon, but the money just

kept coming in. In my first week, I made
about $25.00. By the end of the

second week I had made a total of over
$1,000.00! In the third week I
had
over 10,000.00 and it's still growing. This
is now my fourth week and I
have made a total of just over $42,000.00
and it's still coming in
rapidly.
It's certainly worth $6.00, and 6
stamps, I have spent more than that on the
lottery!! Let me tell you how

this works and most importantly, WHY it
works... Also, make sure you
print a
copy of this article NOW, so you can get the
information off of it as
you
need it. I promise you that if you follow
the directions exactly, that
you
will start making more money than you
thought possible by doing
something so
easy!
Six Bucks and Six stamps... not a big deal
to get lots more $$$$. IT
WORKS!!!!
Suggestion: Read this entire message
carefully! (print it out or
download
it.) Follow the simple directions and watch
the money come in! It's
easy.
It's legal. And, your investment is only
$6.00 (Plus postage).

IMPORTANT: This is not a rip-off; it is not
indecent; it is not illegal;
and
it is 99% no risk - it really works! If all
of the following

instructions
are adhered to, you will receive
extraordinary dividends.

PLEASE NOTE:
Please follow these directions EXACTLY, and
$50,000 or more can be yours
in
20
to 60 days. This program remains successful
because of the honesty and
integrity of the participants. Please
continue its success by carefully
adhering to the instructions.
You will now become part of the Mail Order
business. In this business
your
product is not solid and tangible, it's a
service. You are in the
business
of developing Mailing Lists. Many large
corporations are happy to pay
big
bucks for quality lists. However, the money
made from the mailing lists
is
made from people like you and me asking to
be included in that list.

Here are the 4 EASY, EASY, EASY steps to
success:

STEP 1: Get 6 separate pieces of paper and
write the following on each
piece
of paper "PLEASE PUT ME ON YOUR MAILING
LIST."
Now get 6 US $1.00 bills and place ONE
inside EACH of the 6 pieces of
paper
so the
bill will not be seen through the envelope
(to prevent thievery).

Next, place one paper in each of the 6
envelopes and seal them. You
should
now have 6 sealed envelopes, each with a
piece of paper stating the
above
phrase, your name and address, and a $1.00

bill. What you are doing is
creating a service. THIS IS ABSOLUTELY
LEGAL! You are requesting a
legitimate service and you are paying for
it! Like most of us I was a
little
skeptical and a little worried about the
legal aspects of it all. So I
checked it out with the U.S. Post Office
(1-800-725-2161) and they
confirmed
that it is indeed legal. Mail the 6
envelopes to the following
addresses:

1) Sue Wagner
608 First Avenue
Altoona, PA 16602

2) C. Mangan
503 Oak Ave NW
Elkader, IA 52043

3) Richard Powers
748 Battlefield Blvd. South
Chesapeake, Va. 23322

4) Ryan Palmer
6595 380th Ct.
North Branch, Mn 55056

5)Susan Moreland
233 cr 190
Longbranch, TX 75669

6)Carrie McDonnell
3130-109 Ave S.W.
Calgary, AB Canada
T2W 3H2

STEP 2: Now, you do not need to re-type this
entire letter . Simply put
your
cursor at the beginning of this letter and
drag your cursor to the
bottom of
this document, and select 'copy' from the
edit menu(or right mouse click
and
choose "copy"). This will copy the entire
letter into the computer's
memory

temporarily. Now click "Start" then
"accessories" then "wordpad" Open a

blank 'notepad' file and place your cursor
at the top of the blank page.

>From the 'edit' menu select 'paste'.(or
right mouse click and choose
"paste") This will paste a copy of the
letter into notepad so that you
can
add your name to the list. Take the #1 name
off the list that you see
above,(to do so, put your cursor at the end
of the address of the FIRST
(#1)
address and click "backspace" until name and
address are gone.) Change
the
other numbers to one lower number (6
becomes 5, 5 becomes 4, etc...) by

putting your cursor on the right side of
each number and pushing
backspace
one time, then type the new number and add
YOUR Name as number 6 on the
list. (when you add your name it may be
double spaced... thats ok.)

STEP 3:. Now, post your amended article to
at least 200 newsgroups (I
think
there are close to 24,000 groups). All you
need is 200,
but remember, the more you post, the more
money you make! You won't get
very
much unless you post like crazy. :) This is
perfectly legal! If you have
any
doubts, refer to Title 18 Sec. 1302 & 1341
of the Postal lottery laws.
Keep
a copy of these steps for yourself and,
whenever you need money, you can

use it again, and again.

PLEASE REMEMBER that this program remains
successful because of the
honesty

and integrity of the participants and by
their carefully adhering to the

directions. Look at it this way. If you are
of integrity, the program
will
continue and the money that so many others
have received will come your
way.

NOTE:
Iit might be a good idea to wrap the $1 bill
in dark paper to reduce the

risk of mail theft.) As each post is
downloaded and the directions
carefully
followed, six members will be
reimbursed for their participation as a List
Developer with one dollar
each.
Your name will move up the list so that when
your name reaches the #1
position you will be receiving thousands of
dollars in CASH!!! What an
opportunity for only $6.00 ($1.00 for each
of the first six people
listed
above) Send it now. Add your own name to the
list and you're in
business!

4550. Re: 2.4 ghz radiotelemetry

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-10-29 00:48:40 UTC
From: Tim Mousseau <mousseau@sc.edu>
Message-ID: <39FB73E8.44EDB0C4@sc.edu>
Source record: 10287

Dear Ed,

That is a very clever idea (the pilot transmitter) and worth considering in any new design. However, I have not heard anything else encouraging concerning uhf or higher frequency microtransmitters. I very much doubt there would be any interference problems as the swamps containing these endangered turtles are many miles from any towns, and 50 miles from any significant city (Charleston, SC). And I am doubtful that there is much 2.4 ghz amateur activity in the area!

The commerically available vhf transmitters (154 mhz or thereabouts) are relatively small (0.75 x 0.35 inches approx) and will run for 4-6 months on two watch batteries - they pulse about once a second. But they cost about $300US each. Since we need to put 30+ of these on turtles, this starts to add up big time! Perhaps I will look into cloning the vhf units as an alternative to trying to develop a higher frequency system.

Thanks again for your thoughts.

cheers,

Tim kc4ycx

4551. PSK31 Problem/Question

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-10-29 04:12:20 UTC
From: k6mhe@arrl.net
Message-ID: <39fba290.2275340@news.mcn.org>
Source record: 10288

I am having a problem trying to use PSK31. My problem is that there is a frequency offset of about 76Hz between my transmit frequency and the receive. AFC, Net, Snap are all turned on.. The receive and transmit offsets on the transceiver (a Paragon) are not used.

It seems as if the sound card is putting out a slightly lower frequency on transmit but I have know idea what the problem may be.. RFI??

Anybody got an idea?

alt.radio.digital,rec.radio.amateur.digital.misc,uk.media.radio.misc,aus.radio.amateur.digital,alt.radio.internet.kcuf,alt.radio

On my worldspace receiver, aside the "usual" audio channels there are a
couple of data streams called "Dirmedia data", "ALC data", etc.
By plugging my macintosh serial port to the receiver serial port I can
see there are bits passing, but I don't even know the data rate -neither
do I know what it is.
In the receiver documentation there is no information ("connector for
further extension").
I couldn't find anything on internet...

Does someone know what these channels are, how to record them (with
which software...)?

Many thanks,

Herve

More likely there is a small offset in the transceiver (calibration).
You probably wouldn't notice it on SSB. You could turn on the receive
offset and set it to get the PSK signals on the same freq. I think
DigiPan has an offset function in the works for a future version - a
number of people are experiencing the same problem you are.

Source record: 10298

Welcome to the world of Amateur Radios. It's pretty common to have RX and TX not on the same frequency. I've got one rig that's 160 Hz off. While it's barely noticeable on voice, it's just about useless in digital modes. There should be alignment procedures for your radio to get the two on the same frequency, otherwise, it's time to learn how to set the RIT and leave it alone.

Thanks, but a couple of things. First there is no offset between the transmitter and receiver frequencies (unless I turn it on) therefore the rig does not need alignment. . Second the TX OFF is too course (10 Hz steps). I also have RIT, but that too is in 10 Hz steps. I have been advised by some others that the problem could be with the sound board. I have tried moving computer, monitor and all further away from the rig in case it might be RFI with no change or any improvement at all.

I am next going to try another computer and see what happens.

Thanks for the input.

How did you check that?

>I have
>been advised by some others that the problem could be with the sound
>board.

That seems extremely unlikely to me. This would mean the samplerate for RX
and TX somehow is different. I can understand how the samplerate could
drift, but I presume any reasonable manufacturer would use one single
reference oscillator for all sample rates, so how could they drift
independently?

Rob

Thanks to all that responded..

Yes, the problem is with the rig. I contacted TenTec and they provided me with information on a mod that should fix the problem... Now off to the parts store for a couple of things and will advise the results when I get the mod done.

Thanks again and 73

Again thanks to all who responded to my question.. The problem has
been fixed.... Required installing a couple of diodes to add a
balancing bias on a couple of transistors in the Paragon...

Easy said and hard to do with my old, fat, shakey fingers... But done
none-the-less.

Again thanks to all.

PSK-31 and AGW Packet Engine support planned PacTerm '98 and PKTerm '99
Release 1.5

Muscle Shoals, Alabama. November 1, 2000: Creative Services Software has
announced that PacTerm '98 and PKTerm '99 release 1.5 will support the hot
new mode PSK-31 as well as the AGW Packet Engine. This is the first product
to integrate DSP sound card technology in conjunction with TNC technology.
This release will be a FREE upgrade for owners of the current product and
users who purchase the product today.

New enhancements for version 1.5 include:
- PSK-31 sound card support, using the TNC's keying circuit or
the TNC's serial port for keying the radio with RTS or DTR, saving a
serial port for other functions!!!
- AGW Packet Engine for sound card Packet support
- Support for 2 simultaneous TNCs (1 packet and 1 multimode)
- Point and click to set TNC commands for startup
- Startup/Shutdown commands for each call sign
- 10 mode-specific macros in addition to 10 global macros for
each call sign
- CQ, ID and QRT macros
- Pactor connected station call sign display in title bar

The popular TNC program, written in C++, has been available since November
1997. It supports Multistream Packet, each in its own window, and all HF
modes, user defined macros, user defined colors and fonts, CD callbooks,
COM1 through COM35 (including select USB to serial port converters), Quick
Connects, save session in RTF or TXT format and much, much more.

The program runs under Windows 95/98/Me and Windows NT/2000. It is a true
32-bit Windows application, designed using the Windows Style Guidelines
available from Microsoft.

PacTerm '98 and PKTerm '99 are $79.95. They are available directly from
Creative Services Software or your favorite dealer. You can also download
the program in demo mode from the CSS web site.
Creative Services Software is at http://www.cssincorp.com.

Windows, Windows 95, Windows 98, Windows NT and Windows 2000 are Registered
Trademarks of Microsoft Corporation.

Okay Guys, Im a girl who wants to buy two or more radios for my family.

I have read 90% of this site today, and I think I have a feel for whats out there, however, I must ask you
a few simple questions

1. Based upon your opinion, are the new FRS/GRMS combo radios designed with as many features as the top end Motorola, Cherokee, or other radios?

2. Which FRS/GMRS has THE most features, and works the best?

3. Which of these has the best price for all the features you do get?

4. Should I consider digital transmissions?

Thanks!!!! I'll need your help to make my final decesion.

Tracey

Do yourself a favor and when shipping do not use UPS. They are the most expensive and the most incompetent delivery service available. They find it impossible to deliver even the simplest of package without damage and on time. You do not need the trouble this company will cause.

Read the other 10% of the "site" and you'll find answers such as:

1. There are no FRS/GMRS combo radios...Either FRS or GMRS which shares
some channels with FRS, but requires a license.

2. GMRS has many nice features, but require a license to operate.

3. The Ranger/Fannon Courier models

4. Digital is not alowed on FRS

Funny- My experience has been quite the contrary- My biggest problems
have been Fedex (gets lost when not in the city) and RPS (sends Semi on
country roads with 2lb package)

Another problem is people posting stuff like this on multi-NG addresses,
not on subject- and probably just to get revenge after a dissagreement.

The new Audiovox GMRS raios do not have the option of changing to a better antenna..I would saty away from that setup.

Strange. Over about 5 yrs or so, I've had at least 60 or 70 pkgs delivered and sent through UPS and only two problems. One was delivered two days late and the other was a minor damage problem . They had me fill out some forms and sent me a check for the insurance money within one week. They told me to keep the goods and they didn't even want to look at it. Couldn't ask for better service. Unfortunately, it is inconvenient for me to use UPS and I end up using USPS and with them, have never had a problem.

Herbal V: An Incredible All-Natural Healthy Alternative To V----a

Herbal V is the All Natural Approach to Male Virility,
Vitality and Pleasure.

Available N o w !

Welcome to the New Sexual Revolution.

It's the all natural male potency and pleasure pill that men
everywhere are buzzing about. Herbal V is safe, natural and
specifically formulated to help support male sexual function
and pleasure. You just take two easy-to-swallow tablets
one hour before sex. And there's more great news - you can
get Herbal V for less than $1 a pill.

Amazing word of mouth praise on Herbal V has been spreading
like wildfire-already over 1,500,000 men have chosen
Herbal V. Since it is 100% natural you will never have
to worry about safety. Try doctor-recommended Herbal V
today and have the greatest night of your life!

Herbal V... Bringing Back the Magic!

1,585,000 men can't be wrong. To date over 1 million men
have tried the super supplement Herbal V.
Here is why:

No Doctor Visit Required
Available Over the Counter
Not a Drug
100% Natural
Safe, No Worries
Highest Quality Pharmaceutical-Grade Pure Nutriceuticals
Guaranteed Potency & Purity

Be a Real Man Again!

Questions and Answers

What is Herbal V?

Herbal V is a proprietary blend that was specifically
developed as a safe alternative for men who prefer
an all-natural approach to address impotence and boost
sexual performance. This amazing formula first became
popular with Hollywood insiders and the wealthy elite.
They were maximizing their sex lives, long before it

was available to the general public.

How does Herbal V work?

Developed by a team whose goal was to create the perfect all-natural aphrodisiac. Herbal V is the result of that remarkable effort. The Herbal V formula contains a precise blend of cutting edge pro-sexual nutrients from around the world that provide nutritional support, making it possible for a man to have a pleasurable sexual experience.

What can Herbal V do for me?

Herbal V helps support male sexual function and pleasure in a safe and natural manner. Simply put, it can make your sex life incredible.

Is Herbal V Safe?

One of the great things about Herbal V is that it is not a drug. It is an incredible herbal dietary supplement that provides nutritional support for male sexual function and pleasure. One of the most comforting features of Herbal V is that you never have to worry about safety.

Herbal V: Safe - Natural - Exciting

Many have speculated that because Herbal V is so popular with men, it must contain prescription drugs or chemical components. Herbal V does not contain any elements or traces of any prescription drug. Herbal V is made using the world's most technologically advanced state-of-the-art cold processing equipment to ensure maximum purity. Herbal V has been independently analyzed by the nation's premier testing facility to ensure purity, quality and to end the rumors that, because it is so popular, it must somehow be chemical. It is not. Herbal V is natural - just as it says on the label. Herbal V is simply fantastic!

Herbal V: Ingredients

Yohimbe, saw palmetto, avena sativa, androstenedione, guarana, taurine, siberian ginseng, tribulus terrestris. Tribulus Terrestis is certified to enhanced testosterone levels by increasing Luteinzing hormone (LH) levels. Androstenedione which is a precursor to testosterone unlocks bound testosterone and makes it biologically active again quickly. This means a dramatic surge in desire. Avena Sativa Stimulates the neurotransmitter pleasure centers to maximum capacity. This greatly intensifies pleasure.

Just listen to what Herbal V has done for the sex lives
of people like you!

"On a scale of 1 to 10, it's a 15. Electrifying. It's like
a wonder pill!"
- Justin Q B., New Haven, Texas

"I haven't had sexual relations in 11 years. Then with
Herbal V it was... wow! It works again!"
- Sid R., Lakeland, Florida

"I had sex four times in one night. It made me feel
like a 19-year-old again."
- Chip S, Beech Mountain, North Carolina

"Herbal V has turned my husband into a Sexual Superman!
I like the fact that it's all natural and has no
side effects. It's bringing back the good old days."
- Jennifer B, Beverly Hills, California

The above testimonials are from product literature,
and we have not independently verified them.
However, the following testimonial is from a "senior"
gentleman who has purchased his second bottle of
Herbal V. When we heard his words with our own ears,
we asked his permission to print them here.

"Man! I'm wild as I can be! I feel like I'm 25 years old again!
I'm not believing this!"
- Mr. Murphy, age 64, Lampart, IL.

Risk Free: Double Your Money Back Guarantee

If Herbal V does not give the desired results as stated
above, simply return the unused portion for a
double-your money back refund. No questions asked !

Order Now: Safe, Fast, Secure, Private

Herbal V with its DOUBLE YOUR MONEY BACK GUARANTEE is

I agree. UPS' delivery time has been ridiculous lately. I have been
shipping with the Post Office Priority Mail for items less than 5 pounds
because it is a lot cheaper and quicker. Although, I believe UPS is
cheaper on the heavier stuff than the post office but it takes longer
for UPS to deliver.

Snip big one ....

What a deal ...get screwed at less than a buck a pill. Not only that
but this stuff will let you work over 300 countries, hear DX 1 hour
earlier on your Yagi with out a quad and best of all ... keep your tower
up in a 150 MPH gale. 73 KI3R

Hmm..... I remember a someone who used this address being one of the most
infamous trolls on this group..... nonetheless, I believe the MALE who was
using this address was simply using the *real* Tracey Levin's adress to
post from.... as such I consider this a legitimate post, and will hold no
judgement for now.... in other words, I will consider the poster of this
article to be friendly.

>
>1. Based upon your opinion, are the new FRS/GRMS combo radios designed
>with as many features as the top end Motorola, Cherokee, or other
>radios?

GMRS and FRS radio combos do not exist. You *can* use a GMRS radio on the
7 shared FRS freqs,..... IF you hold a valid GMRS license.

>
>
>4. Should I consider digital transmissions?
>

Digital comms are not permitted on FRS... or any other type of non-voice
communications... (the exception is the 1 year experimental waiver provided
to allow for GPS coordinates to be transmitted via FRS. This waiver was
granted to a specicific company for development purposes)

As far as GMRS... I do not know if comms other than voice are permitted.

Thanks. Forgot to ask. Will the demo version interface with Log
Windows for DX Packet Cluster data? And will it work with Windows Me?

Oh, come on Phil, you didn't really expect a message relating to anything electronic in a radio newsgroup, did you? Since this is a radio newsgroup, the message had to be about United Parcal. Gee, you need to get these newsgroups figured out. Electronics related stuff is discussed in the child birth newsgroup, and I haven't found where amateur radio related topics are discussed yet. If you come across it, let me know.

While there's a lot more to it than what you ask, the program DX4WIN does exactly what you ask. It interfaces to a printer port (parallel) to generate the keying signal. But, then, he might find the logging feature easier than writing. It also supports a number of popular rigs (Icom, Kenwood, Yaseu among them) for tuning.

Yes, it will work with Windows Me, and Windows 2000, as well as all other
flavors of Windows.

The terminal window is not available in demo mode, but it does support both
TNC packet cluster access as well as Telnet cluster accesss.

Oh.....

I thought from the title that you were relating the fact that
if one overcharges the batteries in an Uninterruptable Power
Supply (commonly called a UPS) the UPS will not deliver as much
power as compared to properly charged and conditioned batteries.

True but easy to get around with simple interface adjustments.
The best criteria for a sound card is price, IF , you are not using it for
music.

???

Like others, I must be imaginingg all the PSK31 and other stuff
I'm doing with a sound card under Linux.

For applications like this, the cheaper the better. Cheap sound
cards don't come with all those surround 3D gimmicks - which
may make games sound better, but which raise hell with DSP
applications.

Mine was the cheapest I could find at the computer store on
a Saturday afternoon. ISA, Crystal chipset, $CDN19.00. It
works fine. I didn't bother with amplified speakers: a quick
trip to the local thrift store produced an antiquated but
serviceable stereo amplifier, and a couple of speakers to
hook up to it.

They will all work the same with one caveat; the latest and greatest high end card out may not work with all PSK packages. Unless you are a music freak, you probably don't need the latest and greatest anyway.

I am using an old, small "Car radio booster". It fits in a 5.25 bay (with
some extra mounting hardware) and I power it from the PC power supply.

I removed the loading resistors from the input, and now it works perfectly
on the line level output of the soundcard.

Connected a pair of cheap speakers to it, and the result is much better
than with the average PC speaker set. For real Hi-Fi work I connect the
line out to my music system, and turn off the booster.

Can you explain why that is?
Are drivers for the latest and greatest high end cards not compatible with
normal soundcard drivers?

Maybe, maybe not.

The sound card makers add new and "better" features to their cards; these
new features may cause problems with software that accesses the card at
a low level; i.e. DSP software as in PSK applications.

Keep in mind that most PSK software packages come from people writing them
as a labor of love and not as a commercial project. This implies they
probably do not have access to all the myrid sound cards on the market to
do testing. So if some new card comes out that works just a bit differently
and the software breaks, they will probably not find out about it until some
user reports the problem.

Case in point; I have a machine that will not run digipan or winpsk, but
runs winwarbler just fine. The card works under win98. It doesn't run
right with twpsk under Linux (it is a dual boot machine) either. I forget
which card it is, but it is a pretty new card from Creative.

If I were putting together a machine just for PSK and such, I'd go buy
the cheapest thing I could find.

So, are you saying that you can not talk directly to hardware under windows?

Last time I did any windows programing (admittedly years ago) you could.

Not that doing this is such a good idea, since it leads to precisely the
type of problem we are talking about.

In any case, I have no idea what the problem is under windows. It has the
makers drivers installed. And the latest updates from the maker. Of the
three PSK programs I've tried, 1 worked, 2 didn't, no problems with any
other windows app.

Probably, no quibble there. But that doesn't solve the problem for an end
user.

> play back other sounds?

Everything else under windows seems to work fine. One PSK program (I forget
now which did what) acts like there is no input and the other locks up
and has to be killed with CTL-ALT-DEL when you try to transmit.

> What goes wrong with twpsk? I'm familiar with the source, and
> know that doesn't do anything fancy with the soundcard -
> /dev/dsp and ioctl(). Can you record or play back other sounds?

It works with xawtv and will play audio CDs; that's my limit of interest
in sound under linux on that machine; background noise while doing something
else.

I have no doubt the Linux problem is the driver doesn't fully support the
card. Twpsk works just fine on a different Linux box with an older card.

> The "cheaper is better" rule remains a good one, but not for
> software compatibility, a non-issue. Cheap sound cards are
> more likely to just record the samples and play them back,
> without messing with them.

In this case, from experience, I have to disagree. No matter the base cause,
i.e. broken driver or direct hardware calls, it is more likely that last
months card will be fully supported (or the driver fixed) than next months
card.

I looked at the source and didn't see where it used /dev/dsp. What am I
missing?

The other stuff is addressed in the news reply.

As long as you use windows related software and this software uses the windows sound drivers, all cards will work fine. But some software (running in msdos f.e.) can use only real soundblaster cards.

PS : If you still need to buy a soundcard, considder that a card with a line-in and line-out is a better choise than a card only with a mic-in and speaker-out.

I use both CWGet and CWType. CWGet runs in W95/98/2000 or NT and uses the windows sounndcard. Just put your receiver's speaker-out or line-out and run it into the lin-in or mic-in of the PC soundcard.
CWType uses the DTR signal on a serial port to really key the CW keyer of the tranceiver. You just need to make a DB-9 or DB-25 connector and use ground + the DTR line to the cw-keyer jack.

GWType is free, CWGet is shareware (can be used but all settings can not be saved until registration)
take a look at http://www.dxsoft.com/

xawtv and playing audio cd's (presumably using a CD player with analog
output and cable running from the player to the soundcard) are an entirely
different class of problem...

In these cases, only the "mixer" (volume control) of the soundcard is used,
not the A/D and D/A converters. No driver software is involved except for
setting the volume level, and this may even be at its default level.

Even when IRQ and DMA are not setup or set to conflicting values, this
mixer will still work.
So this tells little about the driver functionality.

A bit better would be to use a DAE tool to get a track from the CD into a
file, and then play that file. That would go via the soundcard D/A.

#1 - VERY BRIEF INTRODUCTION

Due to an enormous client list, I can only take serious applicants at this time. I am offering a full or part-time position in processing e-mail. You can work at home. I do require that you have a computer and are familiar with internet/e-mail functions. As to the salary it's totally up to you. You will be running your own business, the sky is the limit. What you will see represents a totally legal money making business that anyone can generate a significant residual income.

You will receive full instructions, and I will always be available to help you and answer your questions. This is a genuine home business. This is not a chain letter, money game, telecom scheme, or any of the multitudes of dubious "business" offers that come through your e-mail box. This business will generate a residual income of $2,000 to $6,000 every month with only part-time commitment (about 10 hours a week).

A full time commitment (about 30 hours a week) based on statistics gathered from associates world wide, will translate into an income of $10,000 or more per month!

To prove my confidence and sincerity in this opportunity, there is NO CHARGE to join us for the first month. You will receive all information to get started plus the first month's information package ($90 value). If by remote chance you are not satisfied with the program after the first month and want to discontinue, you may by all means do so and I will not contact you again.

But on the other hand, if you are satisfied with the program and wish to continue after the first month, that is when you have to pay $90 for the next month's information package. Since you DO NOT pay anything until after you are already earning an incredible residual income, you have absolutely nothing to lose.

IMPORTANT!

If the above opportunity interests you in the least, and you would like more specific information about our business please contact me at adenby@consultant.com and type in the SUBJECT LINE: "FORWARD PROJECT 21 INFO". Insert your full name, your correct e-mail address, and any specific questions you may have at this time in the body of the message.

We are successful only if YOU are successful, and therefore we will do everything in our power to ensure that your relationship with us is a profitable and successful one. I look forward to your response.

Sincerely,
Angela Denby

> What am I missing?

Because, having just re-checked the source code, it uses
/dev/audio - look at the routine init_audio() in server-main.C.

None of which changes anything: it uses the OS-defined interface
to the sound card, and it uses it the way it's supposed to. If
that doesn't work, there is something wrong with the driver.

Direct hardware access under Linux requires root privilege.
The only examples I've ever come across are programs that use
SVGAlib and its ilk. My own weather satellite program is
an example...

Not quite true. We are ALL oversimplifing the problem (myself included).

> A bit better would be to use a DAE tool to get a track from the CD into a
> file, and then play that file. That would go via the soundcard D/A.

The card will play sound files and will play audio from mpeg video files.

OK, now what? Are you volunteering to to delve into the workings of the
Linux sound drivers and/or twpsk's use of them?

4636. Why users leave the packet network

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-11-08 00:00:00 UTC
From: Roger Barker <roger@peaksys.co.uk>
Message-ID: <gV6r7WAwYYC6EwEJ@peaksys.co.uk>
Source record: 10226

I've just looked at the bulletins that have arrived today on my local packet mailbox. There for my "enjoyment" are parts 1, 5, 15, 17, 18, 23, 27, 29, 33, 37, and 38 of a 40 part 7plus set from an HB9 station. They're all more than 10kb in size, so there's a nice 100kb or so of pure junk for the users to read. Yes, I know that in theory the other 29 parts might arrive, but in practice I know that the possibility is nil.

All over the UK there will be other packet mailboxes carrying this same completely useless junk, and many other examples of the same sort of thing.

In their journey to the UK, these 11 parts of 7plus have twice travelled via the telephone (aka internet links). On the second occasion it was done to span a gap of less than 50 miles between two UK mailboxes.

So, we have a mailbox network carrying large amounts of absolutely useless traffic, increasingly relying on non-radio links to carry it! No wonder the users go away! A packet mailbox network is irrelevant in the world of modern communications unless -

(a) It uses amateur radio.
(b) It carries useful traffic of interest to radio amateurs.

Why is it that an increasing number of mailbox sysops are unable to appreciate that simple fact?

OK, I'll buy that. I didn't think there was a direct reference to /dev/dsp
in the code.

> None of which changes anything: it uses the OS-defined interface
> to the sound card, and it uses it the way it's supposed to. If
> that doesn't work, there is something wrong with the driver.

I agree. The whole point is (was) the latest and greatest hardware may not
have 100% bug free driver support, no matter the OS. That seems to be the
case with this particular card. Is this surprising to anyone?

> Direct hardware access under Linux requires root privilege.
> The only examples I've ever come across are programs that use
> SVGAlib and its ilk. My own weather satellite program is
> an example...

Again I agree. The direct hardware access reference was for windows, not
Linux.

>(b) It carries useful traffic of interest to radio amateurs.

This cannot be the only factor. People move amounts of data much larger
than 100K through their telephone modems just for purposes of appearance,
like a page background and some decorations on an average webpage.

When the existance of 100K of useless data really bothers you, there must
be an underlying problem of a network incapable of carrying such amounts of
data without you (and other observers) getting worried about efficiency
of usage.

This problem has plagued packet radio right from the start: the capacity of
the system was too limited to be able to tolerate any overhead for which
the observer does not see the immediate need. It has been R: headers,
TCP/IP headers, 7+ overhead, you name it. Anything above basic message
content. All attempts to have extra functionality in the network have
been welcomed by few and detested by many others, because of efficiency.

This hasn't really improved over the years, but the expectations of
computer users have. Users want to be able to internetwork, to send
photographs in JPG format, to attach PDF files to their message, to
distribute software. But the packet network has failed to deliver these
features. So users move to a network that does.

There is only one level applications use: the interface provided
by the OS - /dev/dsp under Linux, the MM calls under Windoze. If
those fail then the driver is broken and must be fixed.

> So if some new card comes out that works just a bit differently
> and the software breaks, they will probably not find out about it
until some
> user reports the problem.

If they are using the documented sound card interface then the
driver is broken.

> Case in point; I have a machine that will not run digipan or winpsk,
but
> runs winwarbler just fine. The card works under win98. It doesn't run
> right with twpsk under Linux (it is a dual boot machine) either. I
forget
> which card it is, but it is a pretty new card from Creative.

What goes wrong with the Windoze programs? Can you record or
play back other sounds?

What goes wrong with twpsk? I'm familiar with the source, and
know that doesn't do anything fancy with the soundcard -
/dev/dsp and ioctl(). Can you record or play back other sounds?

The "cheaper is better" rule remains a good one, but not for
software compatibility, a non-issue. Cheap sound cards are
more likely to just record the samples and play them back,
without messing with them.

Easy Money for just one $10.00 bill and one stamp !!!!$$$$
WHAT HAVE YOU GOT TO LOSE???

BY READING THIS YOU COULD CHANGE YOUR ENTIRE LIFE FOREVER!!!
[now you will find US $10.00 bills in your mailbox !!!!! (NOT JUST 1$ BILLS)

! $31,250.00 in 4 weeks!!!!!!!!!

I found this on a bulletin board and decided to try it. A little while back,
I was browsing through newsgroups and came across an article similar to this
that said: you could make thousands of dollars within weeks with only an
initial investment of one $10.00 bill!!!!
So I thought, "Yeah right, this must be a scam", but Like most of us,
I was curious, so I kept reading. Anyway, it said that you send only
one US $10.00 bill to the first address in the list below
You then place your name and address in the bottom of the list at #3,
and post the article in at least 200 newsgroups. (There are thousands)
No catch, that was it.
So after thinking it over, and talking to a few people first, I thought
about trying it. I figured: "what have I got to lose except only
one stamp (not six) and only one $10.00 bill (us fund), right?"
Then I invested the measly $10.00 .

Well !!.GUESS WHAT.. within 7 days, I started getting money in the mail!
I was shocked! I figured it would end soon, but the money just kept
coming in. In my first week, I made about $250.00. By the end of the second
week I had made a total of over $1,000.00! In the third week I had over
$10,000.00 and it's still growing.
It's certainly worth a $10.00 used bill, and only one stamp,
I have spent more than that on the lottery!!

Let me tell you how this works and most importantly, why it works...
Also, make sure you PRINT a copy of this article NOW, so you can get the
information off of it as you need it. I promise you that if you follow the
directions exactly, that you will start making more money that you thought
possible by doing something so easy!

Suggestion: Read this entire message carefully!
(print it out or download it to your hard disk.)
Follow the simple directions and watch the money come in!
It's easy. It's legal. And, your investment is only one $10.00 US bill
(plus postage, only one stamp (not 6 , so the global cost will be a bit more
than 6 letters with $1 in each , but the amount of money you win
will be much more... and your wealth will be all made with thousands of
$10.00 bills ..... not $1 bills as other programs).

IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal;
and it is virtually no risk - it really works!!!
If all of the following instructions are adhered to, you will receive
extraordinary dividends.

PLEASE NOTE: Please follow these directions EXACTLY, and $30,000 or
more can be yours in 20 to 60 days. This program remains successful because
of the honesty and integrity of the participants.
Please continue its success by carefully adhering to the instructions.
You will now become part of the Mail Order business. In this business your
product is not solid and tangible, it's a service. You are in the business
of developing Mailing Lists. Many large corporations are happy to pay big
bucks for quality lists. However, the money made from the mailing lists
is secondary to the income which is made from people like you and me asking
to be included in that list.

Here are the 4 easy steps to success:
STEP 1: Get a piece of paper or a postcard and write the following on it
"PLEASE PUT ME ON YOUR MAILING LIST." , your name and address.
Now get one US $10.00 bill and place it into a dark paper(opaque)
so the bill will not be seen through the envelope (to prevent thievery) .
Next, place the paper or the postcard and the dark paper with the $10.00
bill
in it into the envelope and seal it (please seal it very well).
What you are doing is creating a service.
This is absolutely legal. You are requesting a legitimate service and you
are paying for it! Like most of us I was a little skeptical and a little
worried about the legal aspects of it all. So I checked it out with the U.S.
Post Office (1-800-725-2161) and they confirmed that it is indeed legal!
Mail the envelope to the first address in the list below:
(you send one $10 bill to the first name only)

1.)Oueslati abdellatif
B.P. 86/B , 3100 kairouan,
Tunisia

2.)David Camillier
B5-6900 crabapple drive
Whistler, B.C. V0N 1B6
Canada

3.)Jeffery Vincent
P.O. Box 46
Mittie, LA 70654

STEP 2: Now take the #1 name off the list that you see above, move the
other names up (3 becomes 2, 2 becomes 1,) and add YOUR name as
number 3 on the list.

STEP 3: Change anything you need to, but try to keep this article as close
to the original as possible. Now, post your amended article to at least 200
newsgroups. (I think there are close to 24,000 groups.) All you need is 200,
but remember, the more you post, the more money you make!

This is perfectly legal! If you have any doubts,
refer to Title 18 Sec. 1302 & 1241 of the Postal lottery laws.
Keep a copy of these steps for yourself and, whenever you need money,
you can use it again, and again.
PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way, if you are of integrity, the program will continue and the money that so many others have received will come your way, too.

NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service.
(Also, it might be a good idea to wrap the $10 bill in dark paper to reduce the risk of mail theft. You can send a postcard with the dark paper and use a thick envelope)

Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving thousands of dollars in CASH!!!

What an opportunity for only one $10.00 bill!

Send it now, add your own name to the list and you're in business!

---DIRECTIONS----FOR POSTING TO NEWSGROUPS-----------------

STEP 1: You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document, and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory. If you are having trouble then start by clicking your cursor on the beginning of this letter while continuing to hold down the click button of your cursor. As you do this drag the cursor "all the way down to the bar" and past if need be at the bottom of your viewing screen. Try it and you'll see .

STEP 2: Open a blank 'notepad' file and place your cursor at the top of the blank page. From the 'edit' menu select 'PASTE'. This will paste a copy of the letter into notepad so that you can add your name to the bottom of the list and to change the the numbers of the list.

STEP 3: Save your new notepad file as a '.txt' file. If you want to do your postings in different settings, you'll always have this file to go back to.

STEP 4: Use multiple search engines like
www.dogpile.com/ or www.metafind.com/ to search for various usenet newsgroups (on-line forums, message boards, chat sites, discussions).
If you are having trouble finding any then go on and try www.reference.com/ or www.liszt.com/ or www.forumone.com/ as examples to look in.
You may also wish to tell future readers from around the world that they can read this letter in another language if they visit
http://babelfish.altavista.com/cgi-bin/translate or by going to

www.altavista.com/ and clicking on "AV Tools & Gadgets" and then click on
"AV Translation Service".

STEP 5: Visit these message boards and newsgroups and post this article as
a new message by highlighting the text of this letter and selecting 'PASTE'
from the edit menu. Fill in the Subject, this will be the header that
everyone sees as they scroll through the list of postings in a particular
group, click the post message button. You're done with
your first one! Congratulations... That is it! All you have to do is jump
to different newsgroups and post away. After you get the hang of it,
it will take about 30 seconds for each newsgroup!

** REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!!
BUT YOU HAVE TO POST A MINIMUM OF 200** That is it!
You will begin receiving money from around the world within days!
You may eventually want to rent a P.O. Box due to the large amount of
mail you will receive. If you wish to stay anonymous, you can invent a name
to use, as long as the postman will deliver it.
JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.

Now the WHY part:
.Out of 200 postings, every letter will be seen by hundreds of people but
say that only 5 will participate (a very low example).

So then your name will be posted :
by 5 people at the #3 position
(if every one sending 200 postings refers 5 persons)
your name will be posted by
(5*5) = 25 people at the #3 position
(25*5) = 125 people at the #2 position
(125*5) = 625 people at the #1 position

When your name reaches the first position in a few days, it will be your
turn to collect your $10.00 bills
Now you will receive mooooooooney!!!!!!!

and if just only 5 persons per 200 reply, your name will be out of the list
by
625 * 5 = 3125 persons and everyone will send to you a $10.00 bill,
so you will get

3125 envelopes * $10 = $31,250.00 !!!!!

(10 times more than other $1 programs with
the same number of letters in your mailbox).
AMAZING !!!!!!

$31,250.00!! With an investment of only $10.00!

**You may want to save this page to your hard drive for future use.
The More Times You Re-start THIS group, with your name added last
sending $ 10.00 to the first address and posting again
- everyone listed in THIS group is also started over.

This is why this program is better than others - it never stops!!!!

The thing to remember is: do you realize that thousands of people all over the world are joining the internet and reading these articles everyday? JUST LIKE YOU are now!!
So, can you afford a US $10.00 bill and see if it really works?? I think so...
People have said, "what if the plan is played out and no one sends you the money?
So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try? Anyway,
it is only $10.00 for a chance at thousands.
Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual internet.
Remember, play FAIRLY and HONESTLY and this will really work.
You wouldn't want someone to cheat you the same way you may be cheating!
Yours sincerely,

Jeffery Vincent

Etc...

I'm sorry, but you have missed my point. This data is truly useless. It
is incomplete 7plus. It will never all arrive. Not only that, but the
parts that have arrived have errors in them. This sort of thing has
become very common now on the UK network with the increased used of
internet linking.

Of course people move large amounts of data via modems, but what has
that got to do with amateur *radio*? Absolutely nothing.

Most amateurs in the UK now have internet access. They don't need to use
packet. If they want to receive a large program file, they can use the
internet. Packet only has any relevance because it uses amateur *radio*.
If you remove the amateur *radio* element it has no relevance. That is
the problem - the more internet links are used on the packet network,
the less important the amateur *radio* aspect becomes.

>When the existance of 100K of useless data really bothers you, there must
>be an underlying problem of a network incapable of carrying such amounts of
>data without you (and other observers) getting worried about efficiency
>of usage.

I'm not worried about efficiency of usage. Most of the UK network uses
1200 baud links, and many of them are very poor. Over the years I have
learnt to accept that our network will always be inefficient. I am
worried by the replacement of radio links with internet links, and I am
worried by mailboxes being filled with what is completely useless data.
It really is not very attractive to users to list the messages on their
local mailbox and see a long list of useless 7plus parts.

Being a hobby, you get all kinds of users. Most of the sophisticated
packet users have moved on to more interesting things, and that leaves
only the die-hards and pre-teens.

But I agree, the evidence you list has caused 100's of users to sell their
equipment. Most sold off about 5 years ago, however, so your message
is a little late.

I feel really sorry for you that you guys still have not gotten a network
which transfers BBS bulletins without error...
This was a problem here a decade ago, but once everyone switched to F6FBB
BBS, it was a thing of the past.

Corrupted messages are caused by:
- use of badly designed hostmode protocols (DED, KISS etc) which forget
that the link between TNC and PC has to be checksum-validated as well
- use of network nodes that damage packets in transit, either because of
the use of KISS or because of other design problems
- use of oldfashioned forwarding protocols (RLI/4RE) which don't perform
end-to-end checksumming of transferred messages
- use of unreliable equipment that damages messages while stored in the
BBS.

The latter should not cause really frequent corruptions, but the
combination of the first two does. Once end-to-end checksumming is in
place, corrupt messages are replaced by missing messages or inefficient
repetitions during forwarding. When a proper interface between PC and
AX.25 is in place (an SCC card with proper driver software is an example)
this problem is gone as well.
I have not tried it for a year or two, but at the time I last tried, we
did not see this "corrupted 7+ message" problem anymore for messages that
travelled through systems with reasonable design.

That messages would get corrupted on Internet links really baffles me.
I transfer multi-megabyte files over the Internet routinely and rarely
ever see a corrupted bit.

>I'm not worried about efficiency of usage. Most of the UK network uses
>1200 baud links, and many of them are very poor. Over the years I have

>It really is not very attractive to users to list the messages on their
>local mailbox and see a long list of useless 7plus parts.

Then run a server that collects the 7plus parts into downloadable binary files, and hides them from the listings seen by users. Has been done for years here, and it works. The local BBS also runs a server that allows a user to set a list of accept/reject patterns for messages to appear or not appear in a listing. That way a user can see the interesting topics without being bothered by the useless crap. Imagine what usenet would be if everything was in one newsgroup, and there were no killfiles!

Any information system will always have things you are interested in and things you consider useless. You are not going to fix this by complaining or educating others, partly because the view about what is useful and what is crap differs from person to person. Others may be interested in the 7+ parts to analyze what caused them to be broken so badly, and where that happened (just to give an example).

So, it is better to fix it by improving the user interface.

Rob

Not over here. Our network is only just starting to seriously decline.
But then it's only fairly recently that we have been allowed to use
internet linking...

We do, of course, use FBB in the UK... I am surprised that you think
using FBB is a fix for corrupted bulletins! Corruption usually results
from operator errors, not software bugs.

>Corrupted messages are caused by:
>- use of badly designed hostmode protocols (DED, KISS etc) which forget
> that the link between TNC and PC has to be checksum-validated as well
>- use of network nodes that damage packets in transit, either because of

And the use of modem links...

>That messages would get corrupted on Internet links really baffles me.
>I transfer multi-megabyte files over the Internet routinely and rarely
>ever see a corrupted bit.

Perhaps you do it correctly... Do you read any of the FBB mailing lists?
If you do, you must be aware that there are now lots of mailbox
operators who don't properly understand the basic fundamental principles
of how their mailboxes work, but they are operating internet links.
Recently on the UK network there was an "AX25 versus TCP/IP" discussion.
The lack of knowledge shown by some of the mailbox operators was quite
amazing, but some of them operate internet links. Etc...

>Any information system will always have things you are interested in and
>things you consider useless. You are not going to fix this by complaining
>or educating others, partly because the view about what is useful and what

>is crap differs from person to person.

My point was that, to the average mailbox user, broken 7plus sets aren't interesting. Also, seeing piles of useless junk being passed round from mailbox to mailbox really does make people think "What has this got to do with amateur radio?".

> Others may be interested in the 7+
>parts to analyze what caused them to be broken so badly, and where that
>happened (just to give an example).

That's true, but not the majority of users.

Subject: $6 Deal=20

Date: 10-01-2000=20

Poster: Railsplitter

Message=20

A while back, I was browsing these newsgroups, just like you are now,=20
and came across an article similar to this that said you could make=20
thousands of CASH within weeks with only an initial investment of=20
$6.00 plus stamps! So I thought, "Yeah, right, this must be a scam!"=20
But like most of us I was curious and kept reading. It said that if=20
you send $1.00 to each of the 6 names and addresses listed in the=20
article, you could make thousands in a very short period of time. You=20
then place your own name and address at the bottom of the list at #6,=20
and post the article to at least 300 newsgroups. (There are about=20
32,000 of them out there and that's quite a large market pool). No=20
catch, that was it. Even though the investment was a measly $6, I had=20
three questions that needed to be answered before I could get involved=20
in this sort of thing.=20

1. IS THIS REALLY LEGAL?=20

I called a lawyer first. The lawyer was a little sceptical that I would=20

actually make any CASH but he said it WAS LEGAL if I wanted to try it.=20
I told him it sounded a lot like a chain letter but the details of the=20
system (SEE BELOW) actually made it a legitimate legal business.=20
2. IS OK WITH THE POST OFFICE OR IS IT MAIL FRAUD? I called them:=20
1-800-725-2161 and they confirmed THIS IS ABSOLUTELY LEGAL! (See 18,=20
h sections1302 NS 1341 of Postal Lottery Laws). This clarifies the=20
program of collecting names and addresses for a mailing list.=20
3. IS IT RIGHT? Well, everyone who sends me a buck has a good chance of=20
getting A LOT of CASH ... a much better chance than buying a lottery=20
ticket!!!=20
So, having these questions answered, I invested EXACTLY $7.92 ... six=20
$1.00 bills and six 32 cent postage stamps ... and boy am I glad I did!=20
Within 7 days, I started getting CASH in the mail! I was shocked! I=20
figured it would end soon and didn't give it another thought. But the=20
CASH continued coming in. In my first week I made between $20 to $30.=20
By the end of the second week I had a made a total of $1,000.00. In the=20
third week I had over $10,000.00 and it was still growing. This is now=20
my fourth week and I have made a total of just over $42,000 and it's=20
still coming in ..... It's certainly worth $6.00 and 6 stamps !!!=20
Also, make sure you print a copy of this article NOW, so you can get=20
the information off of it as you need it. I promise you that if you=20
follow the directions exactly, that you will start making more CASH=20
than you thought possible by doing something so easy!=20
Suggestion: Read this entire message carefully! (print it out or=20
download it.) Follow the simple directions and watch the CASH come in!=20
It's easy. It's legal. And your investment is only $6.00 (plus postage)=20
IMPORTANT: This is NOT a rip-off; it is NOT indecent; it is NOT=20
illegal; and it is virtually no risk - it really works!!!! If all of=20
the following instructions are adhered to, you will receive=20
extraordinary dividends.=20
PLEASE NOTE:=20

Please follow these directions EXACTLY, and $50,000 or more can be=20
yours in 20 to 60 days. This program remains successful because of the=20
honesty and integrity of the participants. Please continue its success=20
by carefully adhering to the instructions. You will now become part of=20
the Mail Order business. In this business your product is not solid and=20
tangible, it's a service. You are in the business of developing Mailing=20
Lists. Many large corporations are happy to pay big bucks for quality=20
lists. However, the CASH made from the mailing lists is secondary to=20
the income which is made from people like you and me asking to be=20
included in that list.=20
Here are the 4 easy steps to success:=20
STEP 1: Get 6 separate pieces of paper and write the following on each=20
piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00=20
bills and place ONE inside EACH of the 6 pieces of paper so the bill=20
will not be seen through the envelope (to prevent thievery). Place one=20
paper in each of the 6 envelopes and seal them. You should now have 6=20
sealed envelopes, each with a piece of paper stating the above phrase,=20
your name and address, and a $1.00 bill. What you are doing is creating=20
a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate=20
service and you are paying for it! Like most of us I was a little=20
skeptical and a little worried about the legal aspects of it all. So I
checked it out with the U.S. Post Office (1-800-725-2161) and they
confirmed that it is indeed legal! Mail the 6 envelopes to the
following addresses:
#1) M. Weber=20
801 Oaklands Dr=20
Round Rock, TX 78681=20
#2) S. Patti=20
1808 Ponderosa St.
Cocoa, Fl.,32926
#3) Gill=20

58 Moross

Mt. Clemens Mi. 48043=20

#4) Ryan Dick

7603 Canyon Dr.

Meridian, ID 83642

#5) Y.S.

2702 A Jenner Dr.

Baltimore, MD 21209

#6) D. Sims

905 Burning Bush Drive

Loganville, GA 30052

step 2: Now take the #1 name off the list that you see above, move the =
other=20

names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as number =
6 on=20

the list.

STEP 3: Change anything you need to, but try to keep this article as=20

close to original as possible. Now, post your amended article to at=20

least 300 newsgroups. (I think there are close to 32,000 groups) All=20

you need is 300, but remember, the more you post, the more CASH you=20

make! This is perfectly legal! If you have any doubts, refer to 18=20

Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these=20

steps for yourself and, whenever you need CASH, you can use it again,=20

and again.=20

PLEASE REMEMBER that this program remains successful because of the=20

honesty and integrity of the participants and by their carefully=20

adhering to the directions. Look at it this way. If you are a person=20

of integrity, the program will continue and the CASH that so many=20

others have received will come your way.=20

NOTE: You may want to retain every name and address sent to you,=20

either on a computer or hard copy and keep the notes people send you.=20

This VERIFIES that you are truly providing a service. (Also, it might=20
be a good idea to wrap the $1 bill in dark paper to reduce the risk of=20
mail theft.) So, as each post is downloaded and the directions=20
carefully followed, six members will be reimbursed for their=20
participation as a List Developer with one dollar each. Your name will=20
move up the list geometrically so that when your name reaches the #1=20
position you will be receiving thousands of CASH in CASH!!! What an=20
opportunity for only $6.00 ($1.00 for each of the first six people=20
listed above) Send it now, add your own name to the list and you're in=20
business!=20
---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS=20
Step 1) You do not need to re-type this entire letter to do your own=20
posting. Simply put your cursor at the beginning of this letter and=20
drag your cursor to the bottom of this letter, and select 'copy' from=20
the edit menu. This will copy the entire letter into the computer's=20
memory.=20
Step 2) Open a blank 'notepad' file and place your cursor at the top=20
of the blank page. From the 'edit' menu select 'paste'. This will paste=20
a copy of the letter into notepad so that you can add your name to the=20
list.=20
Step 3) Save your new notepad file as a .txt file. If you want to do=20
your postings in different settings, you'll always have this file to=20
go back to.=20
Step 4) Use Netscape or Internet explorer and try searching for=20
various newsgroups (on-line forums, message boards, chat sites,=20
discussions.)=20
Step 5) Visit these message boards and post this article as a new=20
message by highlighting the text of this letter and selecting paste=20
from the edit menu. Fill in the Subject, this will be the header=20
that everyone sees as they scroll through the list of postings in a=20
particular group, click the post message button.=20

You're done with your first one! Congratulations...THAT'S IT! All you=20
have to do is jump to different newsgroups and post away, after you=20
get the hang of it, it will take about 30 seconds for each newsgroup!=20
**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE=20
MORE CASH YOU WILL MAKE!! BUT YOU HAVE TO POST A=20
minimum of 300**
That's it! You will begin receiving CASH from around the world within=20
days! You may eventually want to rent a P.O.Box due to the large=20
amount of mail you will receive. If you wish to stay anonymous, you=20
can invent a name to use, as long as the postman will deliver it.=20
JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.=20
Now the WHY part:=20
Out of 300 postings, say I receive only 7 replies (a very low example).=20
So then I made $7.00 with my name at #6 on the letter. Now, each of the=20
7 persons who just sent me $1.00 make the MINIMUM 300 postings, each=20
with my name at #5 and only 7 persons respond to each of the 7 original=20
7, that is another $49.00 for me, now those 49 each make 300 MINIMUM=20
posts with my name at #4 and only 7 replies each, I will bring in an=20
additional $343.00! Now, those 343 persons turn around and post the=20
MINIMUM 300 with my name at #3 and only receive 7 replies each, I will=20
make an additional $2401.00! OK, now here is the fun part, each of=20
those 2401 persons post a MINIMUM 300 letters with my name at #2 and=20
they each only receive 7 replies, that just made me $16,807.00!!!=20
Those 16807 persons will all deliver this message to 300 newsgroups=20
with my name at #1 and if still 7 persons per 300 Newsgroups react I=20
will receive $117,649.00! With an original investment of only $6.00!=20
And some stamps. AMAZING! When your name is no longer on the list, you=20
just take the latest posting in the newsgroups, and send out another=20
$6.00 to names on the list, putting your name at number 6 again. And=20
start posting again. The thing to remember is: do you realize that=20
thousands of people all over the world are joining the internet and=20

reading these articles everyday? JUST LIKE YOU are now!! So, can you=20
afford $6.00 and see if it really works?? I think so...=20
People have said, "what if the plan is played out and no one sends you=20
the CASH? So what! What are the chances of that happening when there=20
are tons of new honest users and new honest people who are joining the=20
internet and newsgroups everyday and are willing to give it a try?=20
Estimates are at 20,000 to 50,000 new users, every day, with thousands=20
of those joining the actual internet.=20
Remember, play FAIRLY and HONESTLY and this will really work.=20
** By the way, if you try to deceive people by posting the messages=20
with your name in the list and not sending the CASH to the rest of the=20
people already on the list, you will NOT get as much. Someone I talked=20
to knew someone who did that and he only made about $150.00, and that's=20
after seven or eight weeks! Then he sent the 6 $1.00 bills, people=20
added him to their lists, and in 4-5 weeks he had over $10k.=20
This is the fairest and most honest way I have ever seen to share the=20
wealth of the world without costing anything but our time!!! You also=20
may want to buy mailing and e-mail lists for future CASH. Make sure=20
you print this article out RIGHT NOW! Also, try to keep a list of every=20
one that sends you CASH and always keep an eye on the newsgroups to=20
make sure everyone is playing fairly. Remember, HONESTY IS THE BEST=20
POLICY. You don't need to cheat the basic idea to make the CASH!! GOOD=20
LUCK to all and please play fairly and reap the huge rewards from this,=20
which is tons of extra CASH.=20
Please remember to declare your extra income. Thanks once again...=20
"People have asked me if this is really legal. Well, it is! You are=20
using the Internet to advertise your business. What is that business?=20
You are creating a mailing list of people who are interested in home=20
based computer and online business and methods of generating income at=20
home. Remember, people send you a small fee to be added to your mailing=20
list. It is legal. what will you do with your list of thousands of=20

names?=20

That's up to you." So, build your mailing list, keep good accounts,=20

declare the income and pay your taxes. By doing this you prove your=20

business intentions. Keep an eye on the newsgroups and when the cash=20

has stopped coming (that means your name is no longer on the list),=20

you just take the latest posting at the newsgroups, send another $6.00=20

to the names stated on the list, make your corrections (put your name=20

at #6) and start posting again.=20

NOTES:=20

*1. In some countries, the export of the country's exchange is illegal.=20

But you can get the license to do this from the post office, explaining=20

the above statements (that you have an online business, etc. You may=20

have to pay an extra tax, but that's OK, the amount of the incoming=20

CASH is HUGE! And as I said, a few countries have that restriction.=20

*2. You may want to buy mailing and e-mail lists for future CASH. (Or=20

Database or Spreadsheet software.)=20

*3. If you're really not sure or still think this can't be for real,=20

please print a copy of this article and give it to someone who really=20

needs the CASH, and see what happens.=20

*4. You will start getting responses within 1-2 weeks, it depends.=20

ALSO REMEMBER=20

SEND YOUR $1 OUT TO EVERYONE ON THE LIST,=20

EVEN IF THEY ARE NOT FROM THE U.S.=20

WHAT ARE YOU WAITING FOR???=20

$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!=20

GOOD LUCK!!!=20

Message

A while back, I was browsing these newsgroups, just like you are now, =

and came across an article similar to this that said you could make =

thousands of CASH within weeks with only an initial investment of =

$6.00 plus stamps! So I thought, "Yeah, right, this must be a scam!" =

But like most of us I was curious and kept reading. It said that if =

you send $1.00 to each of the 6 names and addresses listed in the =

article, you could make thousands in a very short period of time. You =

then place your own name and address at the bottom of the list at #6, =

and post the article to at least 300 newsgroups. (There are about =

32,000 of them out there and that's quite a large market pool). No =

catch, that was it. Even though the investment was a measly $6, I had =

three questions that needed to be answered before I could get =
involved

in this sort of thing.

1. IS THIS REALLY LEGAL?

I called a lawyer first. The lawyer was a little sceptical that I =
would

actually make any CASH but he said it WAS LEGAL if I wanted to try =
it.

I told him it sounded a lot like a chain letter but the details of =
the

system (SEE BELOW) actually made it a legitimate legal business.

2. IS OK WITH THE POST OFFICE OR IS IT MAIL FRAUD? I called them: =

1-800-725-2161 and they confirmed THIS IS ABSOLUTELY LEGAL! (See 18, =

h sections1302 NS 1341 of Postal Lottery Laws). This clarifies the =

program of collecting names and addresses for a mailing list.

3. IS IT RIGHT? Well, everyone who sends me a buck has a good chance =
of

getting A LOT of CASH ... a much better chance than buying a lottery =

ticket!!!

So, having these questions answered, I invested EXACTLY $7.92 ... six =

$1.00 bills and six 32 cent postage stamps ... and boy am I glad I =
did!

Within 7 days, I started getting CASH in the mail! I was shocked! I =

figured it would end soon and didn't give it another thought. But the =

CASH continued coming in. In my first week I made between $20 to $30. =

By the end of the second week I had a made a total of $1,000.00. In =
the

third week I had over $10,000.00 and it was still growing. This is =
now

my fourth week and I have made a total of just over $42,000 and it's =

still coming in ..... It's certainly worth $6.00 and 6 stamps !!! =

Also, make sure you print a copy of this article NOW, so you can get =

the information off of it as you need it. I promise you that if you =

follow the directions exactly, that you will start making more CASH =

than you thought possible by doing something so easy!

Suggestion: Read this entire message carefully! (print it out or

download it.) Follow the simple directions and watch the CASH come =
in!

It's easy. It's legal. And your investment is only $6.00 (plus =
postage)

IMPORTANT: This is NOT a rip-off; it is NOT indecent; it is NOT

illegal; and it is virtually no risk - it really works!!!! If all of =

the following instructions are adhered to, you will receive

extraordinary dividends.

PLEASE NOTE:

Please follow these directions EXACTLY, and $50,000 or more can be =

yours in 20 to 60 days. This program remains successful because of =
the

honesty and integrity of the participants. Please continue its =
success

by carefully adhering to the instructions. You will now become part = of

the Mail Order business. In this business your product is not solid = and

tangible, it's a service. You are in the business of developing = Mailing

Lists. Many large corporations are happy to pay big bucks for quality =

lists. However, the CASH made from the mailing lists is secondary to =

the income which is made from people like you and me asking to be =

included in that list.

Here are the 4 easy steps to success:

STEP 1: Get 6 separate pieces of paper and write the following on = each

piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US = $1.00

bills and place ONE inside EACH of the 6 pieces of paper so the bill =

will not be seen through the envelope (to prevent thievery). Place = one

paper in each of the 6 envelopes and seal them. You should now have 6 =

sealed envelopes, each with a piece of paper stating the above = phrase,

your name and address, and a $1.00 bill. What you are doing is = creating

a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate =

service and you are paying for it! Like most of us I was a little =

skeptical and a little worried about the legal aspects of it all. So = I

checked it out with the U.S. Post Office (1-800-725-2161) and = they

confirmed that it is indeed legal! Mail the 6 envelopes to the

following addresses:

#1) M. Weber

801 Oaklands Dr

Round Rock, TX 78681

#2) S. Patti

1808 Ponderosa St.

Cocoa, Fl.,32926

#3) Gill

58 Moross

Mt. Clemens Mi. 48043

#4) Ryan Dick

7603 Canyon Dr.

Meridian, ID 83642

#5) Y.S.

2702 A Jenner Dr.

Baltimore, MD 21209

#6) D. Sims

905 Burning Bush Drive

Loganville, GA 30052

step 2: Now take the #1 name off the list that you see above, move = the other=20

names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as = number 6 on=20

the list.

STEP 3: Change anything you need to, but try to keep this article as =

close to original as possible. Now, post your amended article to at =

least 300 newsgroups. (I think there are close to 32,000 groups) All =

you need is 300, but remember, the more you post, the more CASH you =

make! This is perfectly legal! If you have any doubts, refer to 18 =

Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these =

steps for yourself and, whenever you need CASH, you can use it again, =

and again.

PLEASE REMEMBER that this program remains successful because of the =

honesty and integrity of the participants and by their carefully

adhering to the directions. Look at it this way. If you are a person =

of integrity, the program will continue and the CASH that so many =

others have received will come your way.

NOTE: You may want to retain every name and address sent to you,

either on a computer or hard copy and keep the notes people send you. =

This VERIFIES that you are truly providing a service. (Also, it might =

be a good idea to wrap the $1 bill in dark paper to reduce the risk =
of

mail theft.) So, as each post is downloaded and the directions

carefully followed, six members will be reimbursed for their

participation as a List Developer with one dollar each. Your name =
will

move up the list geometrically so that when your name reaches the #1 =

position you will be receiving thousands of CASH in CASH!!! What an =

opportunity for only $6.00 ($1.00 for each of the first six people =

listed above) Send it now, add your own name to the list and you're =
in

business!

---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS

Step 1) You do not need to re-type this entire letter to do your own =

posting. Simply put your cursor at the beginning of this letter and =

drag your cursor to the bottom of this letter, and select 'copy' from =

the edit menu. This will copy the entire letter into the computer's =

memory.

Step 2) Open a blank 'notepad' file and place your cursor at the top =

of the blank page. From the 'edit' menu select 'paste'. This will =
paste

a copy of the letter into notepad so that you can add your name to =
the

list.

Step 3) Save your new notepad file as a .txt file. If you want to do =

your postings in different settings, you'll always have this file to =

go back to.

Step 4) Use Netscape or Internet explorer and try searching for

various newsgroups (on-line forums, message boards, chat sites,

discussions.)

Step 5) Visit these message boards and post this article as a new =

message by highlighting the text of this letter and selecting paste =

from the edit menu. Fill in the Subject, this will be the header

that everyone sees as they scroll through the list of postings in a =

particular group, click the post message button.

You're done with your first one! Congratulations...THAT'S IT! All you =

have to do is jump to different newsgroups and post away, after you =

get the hang of it, it will take about 30 seconds for each newsgroup! =

**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE

MORE CASH YOU WILL MAKE!! BUT YOU HAVE TO POST A

minimum of 300**

That's it! You will begin receiving CASH from around the world within =

days! You may eventually want to rent a P.O.Box due to the large

amount of mail you will receive. If you wish to stay anonymous, you =

can invent a name to use, as long as the postman will deliver it. =

JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.

Now the WHY part:

Out of 300 postings, say I receive only 7 replies (a very low =
example).

So then I made $7.00 with my name at #6 on the letter. Now, each of =
the

7 persons who just sent me $1.00 make the MINIMUM 300 postings, each =

with my name at #5 and only 7 persons respond to each of the 7 =
original

7, that is another $49.00 for me, now those 49 each make 300 MINIMUM =

posts with my name at #4 and only 7 replies each, I will bring in an =

additional $343.00! Now, those 343 persons turn around and post the =

MINIMUM 300 with my name at #3 and only receive 7 replies each, I =
will

make an additional $2401.00! OK, now here is the fun part, each of =

those 2401 persons post a MINIMUM 300 letters with my name at #2 and =

they each only receive 7 replies, that just made me $16,807.00!!! =

Those 16807 persons will all deliver this message to 300 newsgroups =

with my name at #1 and if still 7 persons per 300 Newsgroups react I =

will receive $117,649.00! With an original investment of only $6.00! =

And some stamps. AMAZING! When your name is no longer on the list, =
you

just take the latest posting in the newsgroups, and send out another =

$6.00 to names on the list, putting your name at number 6 again. And =

start posting again. The thing to remember is: do you realize that =

thousands of people all over the world are joining the internet and =

reading these articles everyday? JUST LIKE YOU are now!! So, can you =

afford $6.00 and see if it really works?? I think so...

People have said, "what if the plan is played out and no one sends =
you

the CASH? So what! What are the chances of that happening when there =

are tons of new honest users and new honest people who are joining =
the

internet and newsgroups everyday and are willing to give it a try? =

Estimates are at 20,000 to 50,000 new users, every day, with =
thousands

of those joining the actual internet.

Remember, play FAIRLY and HONESTLY and this will really work.

** By the way, if you try to deceive people by posting the messages =

with your name in the list and not sending the CASH to the rest of =
the

people already on the list, you will NOT get as much. Someone I =
talked

to knew someone who did that and he only made about $150.00, and =
that's

after seven or eight weeks! Then he sent the 6 $1.00 bills, people =

added him to their lists, and in 4-5 weeks he had over $10k.

This is the fairest and most honest way I have ever seen to share the =

wealth of the world without costing anything but our time!!! You also =

may want to buy mailing and e-mail lists for future CASH. Make sure =

you print this article out RIGHT NOW! Also, try to keep a list of =
every

one that sends you CASH and always keep an eye on the newsgroups to =

make sure everyone is playing fairly. Remember, HONESTY IS THE BEST =

POLICY. You don't need to cheat the basic idea to make the CASH!! =
GOOD

LUCK to all and please play fairly and reap the huge rewards from =
this,

which is tons of extra CASH.

Please remember to declare your extra income. Thanks once again... =

"People have asked me if this is really legal. Well, it is! You are =

Source record: 10242

It's rather interesting that the decline of the UK packet network is being associated with 'being allowed to do internet linking'.

Internet linking is nothing new in the UK - remember the GB7PLY scandal a few years ago ? and there are perhaps little more than two BBSs currently importing bulletins into the UK using non-radio means.

In the south of England, there is one VHF importing BBS, and another using HF. The appearance of overseas bulletins via both is sporadic.

The UK licence is very restrictive when it comes to packet operation. You may not run a BBS without a special permit called an NOV, or any 24 hour operation without the permission of the local Radiocommunications Agency office. Many bandplan allocated node linking frequencies also require you to obtain an NOV permit.

A few months ago, the Radiocommunications Agency wanted to tighten the conditions attached to these permits so that it would be impossible to carry out any experimentation with NOV'd packet links, and BBSs would be forced to carry out an inspection of any messages 'entering the UK network' rather than leaving it as a voluntary task dependent on local need. There was a major backlash from sysops, and there has been no more heard at the time of writing.

Whenever an importing BBS (radio or wired) releases an 'illegal message', onto the network, which 99% of the time is a) the result of an overseas amateur seeking to sell equipment from his shack and b) not written in English, UK BBS sysops will accuse the importer of 'putting their licences at risk'. No distinction is made between radio and wired importers, and the radio importers have the more difficult job and are the first to give up.

You would have thought that the 'advent of internet linking' would mean more BBS messages on the UK packet network. Not a bit of it.

A year ago, I was seeing over 250 bulletins a day on the UK BBS network, at the middle of this year, some 200 per day, now I am lucky to see 150 per day.

Sure - this does correspond with the RA endorsed internet linking initiative, but not the introduction of the wired importing of bulletins into the UK.

It has to be borne in mind that the first major drop coincided with the growth of the Free ISP - an ISP that was essentially free, but where a user still paid telephone charges and the ISP took a cut. The more recent reduction has happened at the same time as fixed price telephone

access charges for unlimited all-day or off-peak internet access have been introduced.

Given the high degree of regulation of UK packet network resource providers, the lack of support given to (radio) importing BBSs, and the reaction to any messages sent by users which were not plain text by a small but very vocal number of BBS sysops, I have not been surprised to see the migration of packet users to a network which is better placed to provide what they want, and does not subject users and their messages with as much contempt as has been evident (once again by a minority) on the UK packet network.

When Roger complains of Junk floating round the network, I know he means Junk. Solitary corrupt remnants of multi-part 7plus floating around.

In days gone by, BBS sysops would complain of the arrival of a large series of 7plus files, and messages written using HTML. No more - those kinds of messages have long departed from our network.

73, Gareth.

4655. Baycom-type program for Win98?

Newsgroup: rec.radio.amateur.digital.misc

From: "Greg D." <gregd@jps.net>
Message-ID: <3A0B9B4B.294F3C1A@jps.net>
Source record: 10243

For years I've been using a home-built Baycom interface under Windows 95 using WinTNC. A new hard drive has forced me to "upgrade" to Windows 98SE, and WinTNC doesn't work anymore.

I checked their website, and there doesn't appear to be a fix.

Anybody have a solution, besides rebooting the machine to DOS and using the original DOS stuff?

Thanks,

Greg.

>to obtain an NOV permit.

This is the (formal) case in most countries of the world. What varies is
the actual enforcement of these rules, and the interpretation of details.

E.g. in the Netherlands it is formally not allowed to run an unattended
station without special permit. But as long as you run it at your own QTH
there will be no problem at all, because the authorities don't bother to
enter in the difficult procedure of proving that you have run it while it
wasn't attended. It is too much effort to get a house search permit for
a minor offense like that.

And even when it isn't at your own QTH, there will be no problem as long
as you are not on the list of people the frequency coordinators don't like.
(the authorities will do absolutely nothing about it unless they get a
request from someone in the radio society, a complaint from another
individual will result in absolutely no action "because of other
priorities").

This means that while there is a formal mechanism of special permits
in place, a large group of stations is operating without any permit at
all (besides the normal amateur radio license the operator hopefully has).

I think the situation is the same in Belgium.
So, don't think you are so badly restricted in the UK, you may just be
reading the regulations too much "to the letter".

>from operator errors, not software bugs.

While I have not run an FBB system except for some tests, I am surprised
that operator errors can corrupt a bulletin. You muse mean operators who
want to edit something out of the bulletin and damage the body?
Operator errors in setting up a forwarding link should not matter, as
the BBS (at least when it talks to other BBSes running the same improved
forwarding protocol!) will put an overall checksum over the messages,
and will reject messages that got damaged on the link.

>>Corrupted messages are caused by:
>>- use of badly designed hostmode protocols (DED, KISS etc) which forget
>> that the link between TNC and PC has to be checksum-validated as well

>>- use of unreliable equipment that damages messages while stored in the
>> BBS.

>And the use of modem links...

I thought you were referring to Internet forwarding. While a modem may
be involved, these are not modem links in the sense that there may be
an unchecked RS232 line involved. Internet forwarding using TCP/IP has
end-to-end checksumming on the packet level.

>Perhaps you do it correctly... Do you read any of the FBB mailing lists?

>Recently on the UK network there was an "AX25 versus TCP/IP" discussion.
>The lack of knowledge shown by some of the mailbox operators was quite
>amazing, but some of them operate internet links. Etc...

I think tens of millions of people use the Internet without any knowledge
at all about TCP/IP and how it functions. Yet they don't experience
data corruption when they read their mail or look at webpages. So this
should be an insignificant factor.

Apparently there is some buggy piece of software floating around. Happens all the time. But that should be fixed, not seen as an unavoidable problem with forwarding over the Internet. If anything, forwarding over the Internet should be much more reliable and have much fewer data corruption and missing parts problems than forwarding over amateur radio links.

>>Any information system will always have things you are interested in and

>mailbox to mailbox really does make people think "What has this got to
>do with amateur radio?".

Well, one thing it has to do with amateur radio is that radio amateurs apparently did not get their packet radio network functioning correctly, and that volunteers are needed to fix that.

Unfortunately the amateur radio world is a prime example of a world where bad communication protocols are designed and then used for decades "because they are there", instead of being fixed when it appears they suck.

I have done a lot of work to fix some things, and we got a flawless BBS forwarding system at that time. I lost interest, and am not active anymore in that area. Apparently the world has moved on, and the naively or stupidly designed stuff is again spreading. You should try to do something about *that*, not complain that people forward bad or incomplete 7+ series.

I think there are more than two. But perhaps there are only two doing it
properly? (Although I'm not sure if there is a proper way of using wire
links on an amateur *radio* network!) Internet links are even being used
over short distances within the UK to replace broken RF links, thereby
removing all incentive to ever properly fix the RF links. (I'm including
in "internet linking" not only "live" IP links, but also things like
importing zips of bundled bulletins.)

>You would have thought that the 'advent of internet linking' would mean
>more BBS messages on the UK packet network. Not a bit of it.

Yes, but one of the justifications for allowing internet linking was to
"breathe new life" into the UK packet network. Of course it hasn't done
that, just as the use of internet links had no positive effect in the
USA. What I cannot understand is why anyone should think that using wire
links to transfer messages should "breathe new life" into an amateur
radio network.

>It has to be borne in mind that the first major drop coincided with the
>growth of the Free ISP - an ISP that was essentially free, but where a
>user still paid telephone charges and the ISP took a cut. The more
>recent reduction has happened at the same time as fixed price telephone

There is bound to be some decline in the use of the packet network as
the internet becomes cheaper, because packet loses most of its
attraction for those whose only interest in it is as a messaging
facility. However, for those who are interested in it because it is
amateur *radio*, its use remains just as valid as it was before cheap
internet.

Why do UK amateurs still get a thrill out of exchanging a few sentences
on 10m with a VK? Not because of the fact that they are talking to
someone in Australia, they can do that any day on the telephone, it's
because they're doing it on amateur *radio*.

The telephone has been available for many years as an alternative to amateur *radio* voice contacts, but it has never been perceived as a valid replacement! Could you imagine any amateur saying "I got my WAC today! First I phoned VK???. Then I phone W????, that one was difficult because the international exchange was very busy. Then I phoned..." So why is the telephone regarded as a valid replacement for amateur *radio* data links?

The main point I have been trying to make in this thread is that by replacing amateur *radio* with wire links, the packet mailbox network becomes a complete irrelevance. Also, at least in the case of the UK, the network has become subjected to a significant number of large, junk bulletins that are a major put-off to many of the remaining users and mailbox operators. Without the use of wire links, there is no way that those bulletins would ever have arrived on the network.

This puzzles me.

Are you simply saying that since the BBS sysops only speak English and thus can not verify if the contents of a message written in a foreign language is legal and thus, complain about it ?

Or are there really regulations stating that UK BBS messages must be written in English ? I have a vague recollection that the UK joined the EU, but apparently I have missed something :-). Or how about messages written in Welsh ?

>*radio* network.

A packet radio network, contrary to a couple of people talking to eachother
on 20M, needs a critical mass of working links to survive. When one link
fails, this may result in a noticable performance loss and people get
motivated to do something about it. But when so many links have failed
that fixing one or two of them will not bring anything, there will be a
downward spiral because people consider "I cannot fix the network myself
because too many other links that I would depend on have failed".
After a while, most of the network has failed and nobody will be in any
hurry to do something about it.
I can understand why some people may have thought that fixing a couple of
links, even when using non-radio means, could lift the whole thing above
the critical mass again. Apparently it hasn't worked out.

>There is bound to be some decline in the use of the packet network as

>attraction for those whose only interest in it is as a messaging
>facility. However, for those who are interested in it because it is
>amateur *radio*, its use remains just as valid as it was before cheap
>internet.

Apparently for many of the users the aspect of messaging was much more
interesting and important than it being amateur radio. That is not
surprising, because the messaging facility was new to most people when
they started to use packet, and they already knew what amateur radio is.
Now, when you show a new (potential) radio amateur the facilities of the
packet network, they will just yawn and wonder how anybody could be
interested in something that slow, no matter if it is amateur radio.
It does not go very much beyond "a very good demonstration tool to learn
about the techniques used in networking", and you claim that is precisely
what the radio amateurs don't want to do...

>Why do UK amateurs still get a thrill out of exchanging a few sentences
>on 10m with a VK? Not because of the fact that they are talking to
>someone in Australia, they can do that any day on the telephone, it's
>because they're doing it on amateur *radio*.

But there probably has been a decline in the number of those amateurs
as well. The difference is in the structure of a digital network that
breaks down and makes the entire network useless when too many stations
drop out. That effect is likely to be much less on a random-contact
point-to-point system like HF DX.
(of course it will die when the number of stations is so low that you
cannot make any interesting contacts. but packet will die much easier)

roger@peaksys.co.uk (Roger Barker) wrote:

> But perhaps there are only two doing it properly?

I think much of the corruption evidenced in wired forwarding are down
to two causes:

BID and From line rebranding: Where a 'helpful' BBS forwards into
another without making arrangements first, and the receiving BBS
treats the message as coming from a local user rather than trunk
BBS traffic.

Corrupt and additional characters:

Where BBS export files are imported into a mailer program, and sent
by internet e-mail to a recipient for extraction and conversion to
an import file for insertion into their local BBS. Wordwraps and
formatting characters may be inserted by mailer programs.

> Internet links are even being used over short distances within the
> UK to replace broken RF links, thereby removing all incentive to
> ever properly fix the RF links.

Your comment raises a very vital point on the question of ethics
with regard to the forced removal or failure of network radio links.
I feel it is worthy of more discussion not just by you and I, but a
representative cross-section of the UK packet community.

What should happen if an area of the UK packet radio network is
cut-off either on a temporary basis, or permanently because those
operating links that travel out of that area have given up, and
operators who could help provide a replacement have not come
forward ?

1) In the case of temporary failure, should BBS operators revert to the
traditional 'disk in the post' system rather than make use of wired
electronic transport ? I should point out to overseas readers that
NOV'd facilities like UK BBSs cannot legally improvise a replacement
link 'on the fly', but must seek official approval first, unless they
are already authorised to operate on that particular frequency with the
specified aerial characteristics and limit of ERP.

2) In the case of a permanent cut-off, should an active regional packet
radio network be abandoned to wither on the vine because of the
reluctance of those outside the area to help provide radio linking ?

> .... one of the justifications for allowing internet linking
> was to "breathe new life" into the UK packet network. Of course it
> hasn't done that

Agreed. The internet linking was happening previously to its 'allowance' by the RA. All the RA did was to ban internet linking, then make it available under NOV (Notice of Variation). Previously, any amateur could undertake wired linking operations under the terms of the 'self-provision licence' that was necessary to make everyday amateur radio operations legal again after the 1984 Telecommunications Act took effect. Out of fairness, the RA was persuaded to 'permit' internet linking by those who did not believe that the facility already existed, and who were concerned with linking voice repeaters rather than data.

> What I cannot understand is why anyone should think that using wire
> links to transfer messages should "breathe new life" into an amateur
> *radio* network.

I think we are quite rightly concerned that wired links will replace radio links. If we consider radio linking to be 'first and foremost' in our minds, and the use of wired links to be second fiddle, then the name of the game is to increase the role of radio links by bringing traffic on to them *that would not otherwise exist* over those wires.

> Why do UK amateurs still get a thrill out of exchanging a few
> sentences on 10m with a VK? Not because of the fact that they are
> talking to someone in Australia, they can do that any day on the
> telephone, it's because they're doing it on amateur *radio*.

I wholeheartedly agree, although I think contacts made via repeaters such as a local packet node do not count towards an individual's achievement in hitting any 'DX'. The achievement is in providing radio based networks as a cooperative activity, and the question is whether we are too proud to carry traffic over *radio* on those networks that has been sourced or transported previously by other means.

As radio amateurs, we may be against replacing radio links with wired links, but how about replacing wired links with radio links where possible ?

73, Gareth.

There is no requirement for amateur radio messages in the UK to be in
English, although as in most countries, messages may not be sent that
are in secret code or cypher.

The problems usually arise either because intermediate BBS sysops have a
wider repertoire of words like 'sale' and 'selling' in other languages
than the importing BBSs do, or a small minority of sysops operate a
'positive proof' policy - where a message cannot definitely be proven to
have broken no rules because it cannot be understood, then it is
branded as 'illegal' and deleted.

Try AGWPE:

http://www.raag.org/sv2agw/inst.htm

This is a great piece of gear. I use the Sound Card interface
at both 1200 and 2400 baud. I only wish it had a 4800 baud
mode, but the next step up is 9600.

It also has the Baycom junk...

That would cause message duplication, but not message corruption.

Don't cut and paste the text into your mail, but attach it as a file.
Preferably use WinZip to compress it first.
When your mailer program still corrupts the text, remove it from your
system. It is broken beyond repair and unsuitable for any use.

Hi,

Just joined this newsgroup and can only see a handful of messages, so this may have cropped up before.

I'm developing a Microsoft Visual C++ V6.0 MFC application for software decoding of RTTY, ARQ, FEC etc via

1/ (Primarily) The bitstream input from Hamcomm-like comparator

2/ (Poss) Source is from audio-in to soundcard

Has anyone got knowledge of some low level VC++ code to 1) analyse and decode the bitstream or 2) perform the FFTs for RTTY decode.

I have had a good look, but I've only got FFT for WinPSK and I'm not sure how to implement phase, frequency analysis of other COMn decodings for FSK systems.

TIA

Philip Cummings

Hi Brian,

Interesting... The problem is that it's like the com port isn't
there. The radio doesn't get keyed for Tx, and when something is
received, nothing appears at the bottom window.

BUT, based on your success I poked around a bit, and suddenly it
started working. It seems like I had to do something to initialize
the com port, because after looking at it with a diagnostic the
radio sprang to life. But then it went inert again after a reboot.

Did you do something special with that com port to prepare it for
use? Windows ini file or something?

Thanks for your help,

Greg.

4684. Adjusting the mark/space on MFJ-1278 ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-11-12 00:00:00 UTC
From: Douglas Snowden <snowden@peoplepc.com>
Message-ID: <3a109038$1@flexnet239.uunt.net>
Source record: 10172

I would like to change to audio output on my MFJ-178 to run on rtty
at lower frequencies so I can use either a 1.2khz or (preferably) .5khz
filter in my receiver. I have the manual, but in following the directions
it shows a formula (525000/freq) + 1 to give it when you are in the
calset mode. I can seem to adjust it by looking at a freq counter for
the standard ssb filter freqs in the 2khz range, but when I compute the
number for something in the 700 to 800 hz range it does not seem to
move down that low. What am I missing? Or will it not move that low?
It is the pits to try and copy stations with the 2.4khz filter in line.

4687. PK232-TS870 connectivity question

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-11-13 00:00:00 UTC
From: Kevin J Prince <kevin@princ7.demon.co.uk>
Message-ID: <o$NS2UAv19D6Ew+Z@princ7.demon.co.uk>
Source record: 10175
Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

Greetings,

I have recently had to send my rig off for a problem. When it arrived at
the fixers, guess what it was working correctly.
Prior to it leaving I have been able to use RTTY via a PK232 using FSK
mode. I have stuck the various connectors where they should be.
But for whatever reason it is now not working.

The connections I have are:
DIN pin1 - FSK center
DIN pin2 - FSK GND

Plus the usual conncector for audio in/out etc.

The receive side is fine on LSB but not on FSK, so I assume that the
signal is there. If I transmit in LSB/USB mode, the transmitter keys up
fine, but the audio level is unreadable (Monitor mode.)
In FSK mode I can receive nothing, but I am, I'm told, putting out a
carrier.

TS870 settings:
Menu 62 - 170 FSK
Menu 63 - off (Mark Pol) Tried it both ways.
Menu 64 - 2125 (FSK tone)

Can someone confirm the various wiring setups for said configuration. So
that I may check them all out.

Is there some setting which has gone completely out of my mind, easy
done these days.....GRIN.

Any help much appreciated.

I've checked all that I can think of....

What's wrong? No transmit? No receive? Really, I totally sympathize.
More than once, I've torn everything apart, and checked everything, and
it turned out to be something stupid.

I am in a hurry to get out at the moment but....if you are using the EU
version of the PK232 then you should set the FSK tones in the TS870 to
the 1275 setting.
More later

4692. 9600 baud Pacsat HT or mobiles?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-11-13 00:00:00 UTC
From: Ken Harris <KHarri4@attglobal.net>
Message-ID: <3A103349.CF601EF7@attglobal.net>
Source record: 10180
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.space

Are there any mobiles (or HTs) that can do 9600 baud pacsat?
I noticed the Kenwood TM-D700A says, "Satellite packet ready",
but it looks a bit bulky and expensive.
Seems to me that they need at least 3 things:

1. 9600 baud
2. 2m/70cm full duplex (separate antenna connectors would be nice)
3. fairly fine frequency control to compensate for doppler

I noticed that the Alinco DJ-G5TH (HT) says, "full duplex".
I suppose this is designed for the AO27.

The Yausu FT90R says, "9600 baud". It looks real small
and is not too expensive.

Please elaborate. The decision is a binary one: either a sound
card works with PSK31, or it doesn't. If it doesn't, you either
try different ones until you find one that does, or you trouble-
shoot the problem and fix it yourself. FUD is unnecessary.

> Linux sound drivers and/or twpsk's use of them?

Twpsk's use of the sound card is completely vanilla. Maybe
I've been lucky, but every sound card I've ever plugged in to
my PC has worked with every application I've ever tried.

My baseline apps, in case you're curious, are twpsk, wavrec/
wavplay, timidity (for midi) and amp (for MP3s). If one
works, they all work. Which stands to reason, since they all
access the sound card through the same interface. My current
sound card is a Crystal-based cheapie. It works with everything
I've tried, but the setup is non-trivial: you have to configure
the Plug and Play stuff, then you have to load the right modules
with the right parameters. It's all documented, and it works.

I have considered updating the (somewhat antiquated) drivers
for some of the nice newer (e.g. SB 128 PCI) sound cards. A PCI
interface can do some very nice things. Some day I may
actually get around to it...

I hardly feel this is FUD. You are losing track of the fact that
we were NOT just discussing Linux programs. You also forgot option C;
try a different application program, which is what worked under
Microsoft Windows98 in this case.

>>
>> The card will play sound files and will play audio from mpeg video

> I've been lucky, but every sound card I've ever plugged in to
> my PC has worked with every application I've ever tried.

Yes, you've been lucky. So the Linux driver is not 100% functional
with this one particular card. I think I stated that about 3 posts back
as a reason to avoid "the latest and greatest hardware" since sometimes
it takes a while for driver support to catch up.

Of course, if you are the sort that enjoys driver hacking, go for it.

> My baseline apps, in case you're curious, are twpsk, wavrec/

And as I have stated before, I have little use for the sound card under Linux (or Windows for that matter) and have tried nowhere near enough different applications to fully execise ALL capabilities of the driver under either OS.

I have no doubt were I to go on sound safari, I would find other things that don't work with this card and the current driver.

4695. Re: SoundCard packet & APRS?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-11-14 00:00:00 UTC
From: "S. Sampson" <S.Sampson@radio-link.net>
Message-ID: <t13pefsh65vhee@corp.supernews.com>
Source record: 10183

I use the AGW Packet Engine. The latest version has great sensitivity
and has the added plus of working both 2400 and 1200 baud packet
on the same channel.

http://www.raag.org/sv2agw/agwpe.zip

With UI-View32 you choose Setup->Comms Setup and select
AGWPE.

Under the AGW icon you go to Properties and add two ports (a 1200
and a 2400 one) then select one of the ports and select OK, and you
will be able to select TNC type to Soundcard and Dualport.

Works fine, lasts a long time...

Hi I would be interested to hear from people who have sucessfully set up packet radio using the sound card as a modem.

I am interested in promoting packet radio and also APRS reception in our area.
Many potential amateurs own scanners and computers equiped with sound cards. I would love to try and put together a disk that cound be distributed in the hopes of further promoting interest in amateur radio.

Please feel free to contact me if you can help in any way?

area's.

- Setting up UIview to RX APRS using a sound card?

- Setting up UIview using a sound card under Win 3.11?

- Setting up packet radio (Say TSTHost) using a sound card.

Consideration should be given to the fact that many people still use older computers like 486's and WIn 3.11. Will these support the sound card drivers?

Any help appreciated! In an effort to further promote amateur radio to new commers.

Reagards,
Ken.

I have been playing with MT63 for only a few days. Have made two contacts, but both were in the 500 mile range. Am looking for other stations, but what are the operating frequencies. I have scanned all the hf bands but that is a hit-and-miss effort. What a wild mode!

"more useful" ??

As a 2m SSB (not FM) audio source, it provides as much fun
as on HF. I'm always surprised at what I hear on the 2m band,
and if you get off the repeaters, you may find it quite enjoyable
again.

That's all the more useful any of it get's. Remember, we are
hobbyists looking for fun, not engineers looking for a new
product, or sales gimmick.

Hi Joe,

I conducted few experiments last year. PSK31 coped pretty well with the
deep fading which can be experienced on VHF but the major problem seemed
to be drifting of Fx with the two stations. PSK31 would track this while
receiving OK but after a couple of overs the stations operating Fx had
drifted apart far enough to have to keep retuning manually.

On checking the specs for my IC821H I see the frequency stability is +/-
3ppm so I guess this could give a worst case of 3x145 (approximate Fx in
MHz) = 435 Hz as the rig temperature increased during long overs. Not
very noticeable on SSB but a lot compared with the very narrow bandwidth
of PSK31.

My conclusion may be wrong but the problem of staying in tune was a real
headache :(

If you manage a 2m contact I would be interested to see if you notice
the same sort of problem.

My experience with a slower computer is that some PSK31 software will work, but some will not. I have seen one program where the computer was not fast enough to display the audio spectrum, but if I disabled that feature it was just able to keep up with incoming signals. You might just have to try different programs until you get lucky and find one that works. You may find the "System Monitor" program (Start/Programs/Accessories/System Tools) helps to show you whether your CPU is too slow to keep up while you are receiving a PSK31 signal (CPU usage lower than 100% is OK, but if it stays at 100% you may have a problem).

I would guess that the "original" PSK31SBW software by G3PLX will work on your computer. If it doesn't, you are probably out of luck. However, with a slow computer you might not be able to take advantage of convenience features such as dual channel receive found in newer software.

If the computer is too slow, you will observe that the screen display gets behind the input (e.g. after the signal you are receiving stops, the program keeps right on decoding for a while), and the program becomes extremely slow to respond to mouse clicks and keyboard input. It is not usable for conducting QSOs this way, as it soon gets so far behind during receive that you cannot switch to transmit in time to carry on a conversation.

Try it and see. This is the only answer in borderline situations
like yours.

Think of what the software does: it receives 8000 samples per
second from the sound card (this is the sample rate many PSK31
programs use). It must process each sample before the next
one arrives, in addition to any other activities the OS may
be performing. If it can't the software won't work. Period.

I've had a 486/66 that was non-functional on PSK31, a P233MMX
that did it with ease, and currently play with a P3/550 that
hardly notices (1.1% CPU time).

I'm not an expert by any means, but could a solution to the frequency drift problem due to temperature be to reduce the RF output of the rig (and the heat produced) and use an external amp to make up for it?

It would make sense that the drift would be from the rig, not the amplifier. If I'm off base let me know cause that's how I'll learn. I haven't been in the game long so I'm probably missing something.

Hi Jim,

You might be able to get a bit more power out of your computer by overclocking the CPU. This is true especially if you have one of the later Intel P75 CPUs. According to what I've read many of these chips are actually faster chips sold as P75s. The story goes that manufacturers still wanted to market P75 computers at a lower price after Intel had switch to making faster chips. To satisfy the demand it was easier to just stamp the faster chips with the slower chip info. there would be no problem with them running at a slower speed and this was a lot cheaper than having to setup the production line to make slower chips...

As to whether this is true or not, I have no idea but I can tell you from experience, I have run P75 CPUs as P100s for years with no problem. the chip doesn't even get hot.. hi.. I had one running as a P120 but decided not to press it. Now I have some spare P75 that are worth nothing (under $5 on the auctions) I should give that a try on one of the old machines.. hi.. I run the CPU at 3 x 33 Mhz and on boot up the computer recognizes it as a P100 and do test programs..

So if you can change the settings on you machine this may be worth a try. All you have to do is watch that the CPU does not run too hot. In my tests, if the CPU doesn't like your settings it either will not start up of will quit after running a short while. Reducing the clocking speed has always got the computer running again.

The real answer here is to consider upgrading the speed of the processor. Since it is getting a little old, if the motherboard will handle something faster, the thing to do is to either try upclocking the existing processor to 100 MHz or finding another chip for $5 or so to run faster. Very possible that the board will handle a faster chip speed.

Hi

Looking for recommendations on a "beginner"s to advance" tutorial for Linux / Unix preferably a pdf file that was intended to be read from beginning to end (not a help or reference manual).

I have seen a lot of them out there and the problem is to choose one and start learning, I can"t read them all.

So far I got:
RUTE USERS TUTORIAL by Paul Sheer
and
UNIX IS A FOUR LETTER WORD AND Vi IS A TWO LETTER ABBREVIATION by Christopher C. Taylor.
Both look good and I"m awaiting your recommendations.

4741. DigiPan 1.5 changes PC clock settings

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-11-21 00:00:00 UTC
From: Martin Walker <mbwalker@netonecom.net>
Message-ID: <3a1b2872$0$83474$45beb828@newscene.com>
Source record: 10130

I recently downloaded and installed DigiPan version 1.5 to upgrade from version 1.2. Every time I start the program, the computer's clock display in the system tray gets changed from 12 hour to 24 hour style. I must go to control panel - regional settings - time to change it back. This did not occur with version 1.2. The computer is a Gateway Select 750 MHz Athlon. Has anyone else experienced this? I have not found any option in the Digipan menus to change this and also looked at the digipan.ini file in the windows directory for possible settings without any luck. It's not a big problem - just a minor nuisance.

Hello,

If you use dxworld.com for your spots you might want to check out a java interface that I created. I like the information that can be found at the site, especially the 6M spots and QSO areas.

But I wanted to change the format of the displayed data slightly, use less screen real-estate and less bandwidth. So I came up with this Java app to do the job. (I also did this project to help me with learning Java and IBM's Visual Age Java environment. I find it's very helpful to have a "real" project when learning another language/environment.)

For more info and to download the classes goto:

What kind of TNC?

I did some AX.25 routines in VB 5 that talked to a KISS TNC
(an AEA DSP-2232, if you're curious). Used them to do things
like monitor 9600 baud satellite telemetry and digipeat
keyboard input off LO-19 and IO-26.

Kevin, you need to use the MScomm.ocx control (in your Vb project) and
know the TNC commands, is like you want to control a modem.

Laura,

Excellent,

Its a PK232 and possibly later I'll want to talk to a Tiny2...

I'm interested in anything you can let me know basically.

Especially how to talk to the TNC while the TNC is already downloading
traffic.. All my experience so far just jumble s the lot together.

Look forward to hearing from you.

Two days ago I ordered 10 pieces of paper money from 10 different countries from a company called Perth Numismatics. Lo and behold they arrived today and they are very nice and colourful. They even have a bill from Antarctica. I didn't even know they existed. These are perfect for stocking stuffers or people who are hard to buy for. The website address is www.perthmoney.com
Good luck and Merry Christmas

Yup, it happened to me yesterday as well. A minor pain but it does
indeed change the system clock. Had me screwed up a bit for a while
because I didn't notice it right away. Hope they know about it and
will correct it. All and all a great program otherwise, I love it.

Why is everybody mentioning the make of his computer??
That has nothing to do with the date/time localization settings...

Apparently that program touches those. An application program should
not do that, but Windows 9x of course doesn't prevent it.

Maybe the author wants to educate fellow hamradio operators about the
existence and advantages of the 24h system?

My starting place was one of the VB 5 sample programs, a
terminal program. From this I was able to figure out how to
use the serial communication control, see incoming data and
prepare outgoing data.

The incoming data routines grabbed the serial input and
submitted it, one octet at a time, to a finite state machine
that decoded KISS. Once the program had received a complete
frame it decoded the AX.25 header, extracted the data and
made it available for further processing.

For transmission I prepared an AX.25 header, glued it to
the data, performed KISS encapsulation and squirted it
out the serial port.

When you do it this way you have to handle the protocols
yourself. Doing it with satellites was helpful, since
all I had to implement were UI frames.

The big question remains: just what do you want to do?

If others had not mentioned the type of computer involved, I might have thought it to be a problem unique to my machine. Obviously, that is not the case after reading all the replies to my original post. I was simply curious if others were experiencing the same thing. Thanks to all who shared their valuable experience and advice. 73

Jeff,

I see that another has already brought up the
balun as the possible weak point, so just
let me relate my experience...

This is with an SA-2040 tuner.

So there I am, running about 400-500 watts
RTTY on forty meters late one night, when my
nose, (a primary diagnostic tool at WG7X),
started telling me that something in the shack was
getting hot! Nothing like the smell of frying plastic
to get you going! After saying my 73 Etc, I put the
'ol sniffer to work, and naturally it centered on the tuner.

Well, it took me about 5 minutes to get a screwdriver
and remove the top off the tuner, and when I did a great big
cloud of white smoke rolled out. I had fried the Teflon tape
surrounding the balun cores... Well, baked it really.

It was a nice golden brown, and still smoking five minutes
AFTER the RF was removed!

All this heating occurred at a 1:1 indicated SWR on my
external meter and about 500 watts forward. The inductor
coil was also a little warm, although to be fair, with the amount
of heat generated while baking the balun, it was a little hard
to tell. I had noted that more heating of the coil occurred at
higher frequencies, especially 10 meters.

The answer here is a remote balun. Nowadays, I use
a Nye-Viking MB-V-A. Now there's a REAL KW+ tuner.
I still have the Heathkit tuner, and will use it at times, but
be very careful at high power, and especially with high
values of SWR.

YMMV... HI!

Gary, WG7X

I have an SA-2060 (and a -2040). I have never used
mine at that power level on RTTY, but my feeling is
that the BALUN is likely the weakest component other
than possibly the antenna switch (in the -2060 only).

I'd be curious what you find out.

You CAN change it back. I did. Just go into control panel then
regional settings then select the time tab and change it there.
Curiously, the 2nd time I ran it the problem didn't happen again.

I have been unable to get the obscure chipset onboard sound on my HP Pavilion to work with Linux. Who can recomend an inexpensive soundcard that they have personal experience with using under linux with Ham packet, sstv, and psk31 software.

Just to preserve bandwidth, Im asking a specific question, No need to reply with "Any SB compatable should work", "I use this soundcard with WINpsk", or "A Soundblaster Super Pro Awe 256 Dolby 3d works great with linux and only costs $795.95". Personal hands on experience with making an inexpensive card work with Linux (Mandrake 7.x) is what I hope to hear about.

Even though this will piss off some usenet hardliners, I would apreciate it if replies were to 'CC' my personal address. If this request offends someone then by all means, send the reply only to the list. Ill still see it, just delayed. Much as I would like to read every message every day, realities of time management force me to read only a hundred or so once or twice a week.

Now that I've authored my one sentance question and two paragraphs of attitude, Ill shut-up and hope I havent offended the people with the answer so much that they wont respond.

Steve

I use a soundblaster 16 pnp. It works fine on psk31 and sstv and is not
difficult to set up.
I first used it with Redhat 6.2, but am now running SUSE 7. I'm pretty
new to linux,
but did not have too many problems getting going.

Hope this is of use.

Did the the isapnp.conf setup prove any particular challenge to get setup?

You know, Someone ought to develop a soundcard specifically with hams in mind. With a PTT interface and switch options to make the input and output directly compatable with and isolated from various radios. Using a chipset which is widely supported and/or documented well enough and openly that support would follow.

4772. Serial Port Problems with PSK

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-11-25 00:00:00 UTC
From: "Dr. Edward H. Scissons" <psa@sk.sympatico.ca>
Message-ID: <WqPT5.1351$jo.12386513@tomcat.sk.sympatico.ca>
Source record: 10060

I am using K4ABT inferface for PSK. I am experiencing a computer problem that I do not think is the problem of the interface.

When I first turn on the computer, the transmit light goes on and off once or twice through the boot up cycle. When the computer has completely booted up, the transmit light comes on and stays on. If I load up Digipan the light goes off until I transmit in PSK and then goes off as soon as I switch to receive.

If I exit the program, the transmit light comes on again and stays on. When the light is on, my rig is in transmit so the effect is that if I want to use my rig for listening or on other modes than psk when the computer is on, I must leave Digipan running in the background (or presumably one of the other programs such as PSK).
Have anyone heard of this before.

It seems that my serial port defaults to the transmit condition unless Digipan is running and that returns it to the receive condition until you hit the transmit button. Is there some way to configure the serial port so that its default condition is not transmit?

Any advice.

Thanks.

Ed VE5VX

BSA deploys imaginary pirate software detector vans
By: Kieren McCarthy
Posted: 08/11/2000 at 10:57 GMT

The Business Software Alliance aka The Pirate Busters is growing
so frustrated in its hopeless efforts to cut down on software piracy
that it has decided propaganda and misinformation is the way forward.

Visitors to Glasgow Central Station yesterday were surprised to be
confronted by a Ford Transit van with a small radar and rusty Sky
satellite dish mounted on top. What was this apparition? Why, the
BSA's latest weapon in the war against software-stealing scum.

A wise reader asked one of the "consultants" what exactly the dishes
were able to do and was informed they could detect PCs running
illegal software. When pushed a little further, she admitted the van
was "just a dummy" but the BSA still had a fleet of the real things
rushing around Scotland detecting and nabbing unsuspecting
criminals.

Expressing incredulity, things turned nasty and our loyal reader was
threatened. He'd "better watch out" because the BSA with its new
super software-finding equipment will "get him easily". He quickly ran
off and slid into the shadows before he was photographed and his
face wired to Interpol and the CIA.

Can you believe this? This has to be one of the most insane things
we've heard in years. The BSA needs to take a valium and lay down
for a bit.

Ah, yes, the wonderful AD1816-based Pavilion soundcards, I'll bet,
that don't work with any of the standard 1816 drivers. :-(

>

I use the Creative PCI 128 in one machine running Linux, and it
works just fine for everything from the soundmodem drivers to Quake 3. :-)
You use either the Ensonic 1370 or 1371 drivers for it, based on which
particular chipset the board contains. I believe it was about $40.00.

I also have the Creatve 16 AWE PnP ISA card, which was a *major* pain
to use. Apparently there are a *lot* of different chipsets that have
been used for this card. I ended up having to purchase the commercial
OSS drivers ($15.00) to get it to work well - none of the free OSS
drivers were usable.

Hi Steve,

I've had good sucess using the Crystal Chip set I've seen these Crystal
boards mine is 4235.. for as little as 20 bucks , check around see if you
can find one.. also the Ensonique boards have worked well with my linux box
, but are a bit more expensive..

Heh. Have you been monitoring r.r.a.digital.misc at all? Forwarding
via the net, even to keep an isolated community alive, is highly
contentious.

You might consider HF forwarding, I think there are a few HF gateways
still around.

If you really do press ahead with plans to build new packet infrastructure,
do your darndest to make good use of this "second chance" and insist on a
minimum of 9k6 links.

Source record: 10071

I asked the same question a few days ago. The following is a technical explanations that I received.

Here is a quote from the help file for the original G3PLX PSK31 program (PSK31SBW):

"For paths where errors occur in bursts rather than randomly, PSK31 can be switched to use a convolutional code at the transmitter and a matching Viterbi decoder at the receiver. QPSK, with 4 phase-shifts instead of two, is used for this, but the bandwidth and text speed stay the same. The price paid for this robustness is a tighter frequency stability requirement and a delay of 640mS in the decoder."

I tried QPSK on 10 meters a few days ago and could not maintain contact. I hang out on 10 mtrs at 28.120 +/- and would like to try qpsk sometime.

You can't "insist" on anything. It's a hobby. You can bet it will be
1200 baud and low buck.

I would probably spend the little money available on an S-Band system
for the Oscar 40 satellite. This will make HF packet a dead issue.

IMHO most people just use the default (which is BPSK for most programs) and pay little attention to the signal type. I've seen several ZL and VK stations calling CQ on 20 and 10 in QPSK that got ignored.

An occasional glance at the "phase scope" to see if there are 2 lines or 4 would be in order if you want to work some DX.

Fellow Packeteers,

It looks like packet is once again becoming popular in New
Mexico again (perhaps the WWW is losing its touch and people are
resorting to packet for Amateur Radio fun?), particularly the
Albuquerque, Roswell and Santa Fe areas.

Full-time, forwarding BBSs are alive and well in these cities,
but there are no links outside of New Mexico via nodes yet. This
means we are unable to forward packet traffic in and out of the state.

My question is...how can we get traffic to and from our BBSs?
Is there any place on the Internet where the SYSOPs can download the
traffic (bulletins, personal messages, etc.) to the BBSs? Are there
any other alternatives, other than setting up nodes (which we plan to
do sometime soon I hope)?

Any help/suggestions would be greatly appreciated.

Hello, could someone please point me in the easiest direction as to where/how I can purchase/construct a cable to connect my Garmin GPS III+ to my Kenwood TH-D7a and another one to connect the GPS to my Kenwood TM-D700A?

Please and thank you.

Phil,

Some logging software gives you that information as you enter the call
prefix of the station you are working, or the DX spot you want to work.
DX4WIN, for example, lists the direction and distance to the remote station,
and also includes a 'globe view" of the short- and long-path routes from
your QTH to the other station.

<Standard Disclaimer: no ties to DX4Win, just a happy customer>

Hello All:

I'm looking for a piece of software that will allow me to use my computer as fsk (afsk) tuning indicator for the HF bands. Should have settings for 170Hz, 200Hz and 1Khz.

Need for receiving 1200baud bell202 on 28188.50 packet.

Thanks

de Richard/N2JR

How about one of those "spectrum analyzer" (with classic display or
"waterfall") programs?

As always start here for sound card programs.

http://www.muenster.de/%7Ewelp/sb.htm

Can't tell you which one will do what you want, but lots to choose
from. Maybe the wintone program.

There are some teletype programs that are nice for the 170 and maybe 200
hz. Look at the mmtty program. It has a nice display for the tones,
not sure if it will do 1000 hz or not.

> reply with "Any SB compatable should work"...

This is all under various versions of Slackware, from Slackware
97 to 7.1, systems ranging from 486/66 to P3/550.

Current system: no-name Crystal-based card.
Past: SoundBlaster 16 ISA.
Experimented: SoundBlaster 128 PCI.
Abandoned: CMI8330 SoundPro on motherboard.

I found that I could play sounds just fine on the CMI8330,
but couldn't get it to record. Obviously a mixer problem,
but with sound cards so cheap I opted for a replacement.

The current Crystal card is Plug-n-Pray. I set it up in Windoze,
wrote down the settings and configured it with isapnp. No sweat.

SoundBlaster 16 ISA worked with everything. As it should.

SoundBlaster 128 PCI sounded gorgeous, so I gave it to my
Mum (who does lots of music and stuff). Overkill for making
modem noises.

The general rule remains: the cheaper and more generally
brain-damaged, the better.

It's really not that big an issue. Honest. If it doesn't
work, take it back.

Sorry, but these are long obsolete, and completely unobtainable.

Shred any magazine article that uses them.

Any equipment that needs a replacement is scrap.

Consider MX-614 as a current (but not drop-in) replacement.

It's mainly the technology (1200 baud AFSK) that is obsolete, and has
resulted in the chips to become discontinued and unobtainable.

Defeating that by choosing a chip from a smaller manufacturer that still
sees a niche market is not really the best approach. It is better to
move on. Come on, are you still using that V.22 telephone modem??

Source record: 10002

Hello,

I have found lots of information on this, but I am not sure if I can do what I would like--

I would like to set up a packet station at my home (with radio/tnc), connected to a computer that will route the packet traffic to/from the internet.

For example, if I had my laptop with me in my car, I would have a tnc/radio, and would like to be able to create a tcp link to the internet over my packet link. I want this to work so I can run things like http/smtp/telnet, and other normal internet protocols to connect to internet servers.

Is this feasable?
I understand what I need for radio equipment, although any suggestions are appriciated, but my main concern is what software package I would use to do this both on the gateway machine and on the laptop. I would prefer to run windows on both ends - gateway and remote client.

Any information would be greatly appriciated.
Thanks,
Scott

Scott,

I had done a research project during college and there were a number of issues with doing this. Primarily we didn't want people who were not hams to be using the gateway out from the internet as this would be a violation of FCC rules (must have license yadda yadda yadda)

The system worked pretty good. It was based on JNOS. The primary function was to allow AMPRNet traffic from a different geographic location to be routed through our node and out our antenna. As for going directly from internet->amprnet not a good idea. Consider the 44 network as a non-routable network from the standpoint of the ARPANet/Internet.

Nope. :-)

You're right: manufacturers stop making the chips because there
is no commercial market for them.

I always wonder about the insistence on compatibility with local
networks: here in Vancouver I rarely hear any 1200 baud AFSK on
the packet frequencies. There is thus no local network to be
compatible with...

Thanks to all who replied, I've found a UK supplier that can supply the 3105s. The project is the conversion of a couple of ex-commercial TNCs using the FX439J modem (1200 and 1800Hz tones) to allow access to APRS, which in the UK is still getting going and is principally on 144 MHz at 1200 baud. The TNC in question has sockets on the board for either chip and so avoids having to make mods, it's just a straight swop.

Regards,

Roger, G3VKM

This means that the resistance to progress must be very deeply rooted
in your region. What you should have done (like we did here and was done
in many other places) is introduce your fellow amateurs to higher speeds
when they became available.

We have had 4800 bps accesses on nearly every node and many BBSes for
at least a decade. 9600 bps was added later in many places. When the
node or BBS has a higher speed available, a lot of users will follow.
Especially when schematics for modems are made available, and/or PCBs
and parts kits are sold by a couple of active amateurs or small businesses.

Just sitting down and crying "nobody is using speeds above 1200 bps so I
cannot upgrade" isn't going to bring anything.

This is similar to the situation in telephone modem land. When the BBSes
and later the Internet access companies would not have upgraded their
modems, we would all still be connecting at 2400 or maybe 9600 bps.

But they did, and the callers followed. Nobody is asking for old modems
in the shops, so apparently this worked well. Only some banks (accustomed
to writing off equipment over a period of 5 years or more) still operate
V.22bis dialups for their telebanking...

Etc...

I am very pleased for you that you have such a good packet network in
your area. Why the UK network never really moved to higher speeds is a
good question, but it is totally academic in this particular thread. The
fact is that most of our packet is still 1200 baud, and there is
therefore a need for 1200 baud modems. To ignore that fact and simply
say "move on" would be to ignore the reality of the situation.

Also, there is now a growing APRS network on 1200 baud. I see a lot of
1200 baud APRS coming from your country, so it looks like even in your
area you still have a need for 1200 baud modems?

See DXMon by VE3SUN...

Gives you a great circle map, distance, bearings etc!!

Best of all it is FREEWARE!! No need to buy expensive logging software!

(see http://www.benlo.com/dxmon.html)

The best way to get these obsolete chips, is to buy some
TNC's for parts. But I concur that anyone designing anything
new using that chip is misguided.

Mm, but if I moved on, I would be all on my own. A luvly high-speed
system with no-one to connect to... That's the problem - In much of the
the real world of packet (as opposed to the theoretical world of packet)
there's still an unavoidable need for 1200 baud modems.

There is also GEOCLOCK with the HAM RADIO PACKAGE. But it is a little
pricey.

Many logging programs in the same price range have a similar map feature!
See DX4WIN and LOGIC (www.hosenose.com), etc...

The web page for Geoclock is http://home.att.net/~geoclock/

The "atomic" clock you can buy at radio Shack reads one of the LF WWV transmissions and decodes the time info imbedded in it to keep itself corrected.

Anybody written sound board software to extract this time signal from the output of a radio tuned to that same WWV freq?

Sure would be nice to have an "atomic" clock in the PC.

Jerry W4UK

If you have an internet connection you can set your PC clock from NIST directly. I use NISTIME-32BIT.EXE to automatically reset the clock once per day on one of my PC's that runs a sensing application and has poor timekeeping. You can get software from;

http://www.boulder.nist.gov/timefreq/

To just display the time with a geochron style graphic;

http://www.time.gov/

What radio are you talking about? You would need a radio and antenna that work at 60 kHz, and convert the modulation used on the WWVB signal to an audio tone in order to feed it into a PC soundcard. At that point, all you'd need is software. But is there a suitable radio for this?

I have an ICOM PCR-1000 receiver already hooked up to the PC and the audio is already fed into this PC's soundcard.

I think lots of guys would use the software. If a receiver were not already available, it should be pretty easy for homebrewers to cannibalize one of the existing cheap clocks to get the receiver and feed its output to the computer sound card.

C'mon, somebody, write it. Let it operate under Windows and let it set the PC's clock automatically and then reset it periodically. I am stupid, or I would do it myself.

I was trying to do a meteor scatter packet radio operation during the Leonids last week, in which I broadcast my packets during a prescribed 15 seconds of every minute (see http://go.to/BEACONet). My PC clock kept drifting so much I wandered out of my time frame after only a few hours. Lots of other applications for a precise clock in CW meteor scatter calling, etc, also.

The time signals are there, so why not be using them???

>area you still have a need for 1200 baud modems?

The problem with the APRS folks is that they invent everything anew, and
fall in the same traps as the network folks a decade or two ago.

When the first two packet users came on the air, they could make a CONNECT.
When the third user came online, he could not connect one of them, and
the DIGIPEATER was invented. This "worked".

But when everyone in the area was on packet, the sheer number of collisions
made any contact impossible. So, the "hop to hop" acknowledge "idea" was
invented, and NET/ROM appeared.

This worked better, but there still was the problem of hidden stations,
causing excessive collisions.
This was solved by putting each NET/ROM local access on a different
frequency (re-using frequencies only at larger distances), and linking
them together using a network of point-to-point links on another band.

Now, each local access area was an isolated small community on which it
was relatively easy to propose to change to a higher baudrate, especially
when the old rate remained available for some time.
This is how it was done. Higher rates were added and in the more busy
areas, 1200 baud was gradually phased out. Users could still connect to
anyone via the node, as it would do the rate conversion as required.

Enter APRS. Rewind tape. Everyone again on one frequency, using a
single speed, using digipeaters. Slowly they find out the same problems
as population increases.

But they have largely painted themselves into a corner by requiring
that everyone can hear everyone on a single channel. "Intelligent
digipeaters" are re-invented to partly solve the problems, but a real
solution requires a fundamentally different approach, like a re-invention
of the cellular frequency planning. This will of course make mobile use
more difficult, especially for amateurs that only want to use existing
commercial equipment that would not lend itself to some form of automatic

frequency control.

In this world, which is largely separate from the previous packet
experiment of BBSes and nodes, it is not surprising that the same error was
made when selecting an operating speed.
However, there are groups that use higher speeds. On 70cm, not the
144.800 net you are probably referring to.

Why do you want to use a soundcard?

Here in Europe the transmitter of choice is DCF-77, and many household
clocks for it exist. They can be bought for prices starting at the
equivalent of US$ 10..15 (for a battery-powered alarm clock)

The output of the receiver section already is a digital signal.
So instead of feeding this into a soundcard, one connects it to some
spare input (usually a status signal on the RS232 port).

Several programs exist to sync the PC time using this setup.

Who would want to tie up an expensive receiver for this?

Doesn't CHU (3330 kHz, 7335 kHz, and 14670 kHz, Ottawa?) transmit time standard data as Bell 103 standard FSK on AM? There are lots of hardware construction articles and software out there to easily decode this data stream.

Nowadays, people also use GPS sattelite signals for time standards as well. I believe there are sync error tables published on WWVs web pages somewhere.

Ok. Does the PCR-1000 tune down to 60 kHz? When you tune there,
what does the signal output look like? The PCR-1000 has a number of
demodulators available (FM, WFM, AM, SSB, CW..) but the WWVB signal
almost certainly doesn't use any of those modulation schemes. Does
the PCR-1000 give a decodable signal out anyway in any of those modes?
And, if so, is the signal actually an audio signal that can be digitized
successfully by a sound card, with its limited frequency response?
These are the kind of details that determine whether this is possible
or not.

>C'mon, somebody, write it. Let it operate under Windows and let it
>set the PC's clock automatically and then reset it periodically. I am
>stupid, or I would do it myself.

There's another possibility, too: just about any board-type GPS receiver
outputs the current time and a pulse each second, accurate to a microsecond
or so. This can be used to keep a PC clock quite accurate, and there's
software available for this. If you only want accuracy to the nearest
second or two, any handheld GPS receiver with NMEA output will do.
See www.tapr.org for suitable hardware and software.

Take a look at www.infracom-fr.com or www.infracom.fr they distribute
COMTECH tuners on 1.2 and 2.4 GHz. A single tuner costs around 250 Frs
I think, 38.11 EUROS or about 32 USD. Ask them, I'm note sure that
tuners are shown on their website, but they show 1.2 and 2.4 GHz TV
modules, with PLL controler, amplifiers, and so on.

Richard

Yes, that could be (a large) part of the explanation.

Not only that, but the system has also been built out to be a replacement
of the original "keyboard to keyboard chat" system that connected mode
packet was. This causes an awful lot of traffic, as every packet an
operator types is broadcast and repeated over a large area until the
destination finds a chance to broadcast his reply back.

This was bad in the times of normal digipeaters, but it is even worse now
that generic digipeater names like RELAY and WIDE are used, for which
several stations repeat the same packet.

Ideas like this work fine under light loading, but once the load exceeds
a certain limit there will be a collapse because acks are not coming back
and the re-transmissions increase the load that was already high.

Of course this problem could be reduced by a factor of 8 by changing to
9600 instead of 1200 baud, and thus reducing the channel load by such
a factor (assuming TXDELAY is reduced accordingly).

In the U.S. it's not a problem, because more Hams are dying every
day, than are being replaced, with only a fraction of the total population
having a digital capability.

The answer of course, is to use S band with the new AO-40 satellite.
It should be able to handle digital voice, data, keyboard, and GPS
beacons without breaking a sweat...

Unfortunately this (and the text you quoted) is a very partial account
of what is going on. Not much is known to the public and jumping on
the bandwagon of this protest might be not exactly the best thing, at
least not without informing yourselves:

It *seems* that central issue in this conflict is if the sysops should
be allowed to exclude and route selectively ("censor" in the words of some)
based on originating call -- arbitrarily and without giving any reason or
informing the regulatory body.

Conflict seems to have escalated when the amateur radio association "AGZ"
(http://www.agz.net) wanted to distribute their anti code-test bulletins
and calls of AGZ members were blocked (out of pure dislike in a discriminatory
fashion?) in the process. RegTP *seems* (the paper is still not available
publicly) to be of the opinion, that this is not acceptable under current
law and that content on the network cannot be filtered out (or "censored")
unless it is against German law. Therefore they revoked two digipeater
licenses that were involved in these actions.

At the moment there is quite a flamewar about this in de.comm.ham (the
German-speaking ham newsgroup) and I think you would get responses of
both parties in this conflict there -- if you were interested.

This is *not* an issue "us" vs. the evil regulatory body however!

This thing is already very emotional (like the pro/anti CW test fights
in rrap in some way) and *not* a one-dimensional clearly cut thing.

Both WWV and WWVH broadcast time/date signals continuously on HF. Listen
to them using a receiver with decent low frequency audio output. That
low frequency tone (sorry I don't remember its frequency off hand) that
starts exactly on each second pulse and lasts for a fraction of a second
contains the code. The longer tones are 1s and the shorter ones are 0s.
These are the tones that the famous Heathkit Most Accurate Clock used.
Should be no problem at all to detect and decode them with a sound card.

Dave, the signal is at 60 KHz, and is modulated by a 10 dB reduction at
a rate of one bit per second. You would need a frequency response down
to DC to use a sound card.

I don't see that as an "error." I see that as an issue of supply. As all the BBS's and nodes went to 9600 baud, there was a flood of 1200 baud packet equipment on the used market....

They're repeating history because they're USING history!

4846. [EMERGENCY] German Packet Operators Need Your Help

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-11-30 03:32:36 UTC
From: nr0d@qsl.net
Message-ID: <128@xqt15.com>
Source record: 10027

Over the last few years I have spent a considerable amount of time
'surfing' the EU packet network. When the solar cycle was low, I accessed
it via a wormhole. For over a year I have been using HF
pactor to connect to the network using the various gateways there.

The robustness and efficiency of the EU packet network is astounding.
It works so well I suspected that there were alot of wireline links
involved, but after inquiry to several sources have found it is all
done via RF links. I guarentee if you spend just a few minutes working
on the EU packet network you will get hooked, and spend as much time as
possible working their incredible network.

Sadly, the German Regulatory Authority for Telecommunications (RegTP)
is trying to draft a decree which would effectively disable the German
packet network. The harm done to the entire EU network would be great
if this happened. In the enclosed message, there is a request to send a
polite email to the RegTP asking them not to pass the decree. Please
send an email to them in support of our friends in Europe !

Here is a message from Tom, DL3SBB and Uli, DK2GO with more information:

-----CUT HERE-----
From: DK2GO @ HB9EAS.CHE.EU (Uli)
To: SYSOP @ WW

Hi,

we'd like to inform you about the current situation concerning the
german paket-radio network.

As a sign for protest a lot of german packet radio SysOps will cease
operation for a certain number of days starting on November 24, 1900z.

Major AX25 nodes in Germany will shut down their links with the
execption of their local user access. All additional supplementary
services like BBS, DX-Cluster, convers, TCP/IP etc. will be shut down
too.

Therefore participating stations won't be routable through their
networkinterlinks. BBS message and bulletin forwarding will be
interrupted in most parts of Germany during the protest. There are even
some "foreign"nodes, close to the german border, participating.

Reason for the SysOps' protest is a draft of a decree
("Amtsblattverfuegung") by the German Regulatory Authority for
Telecommunications and Posts (RegTP).
If this draft will become reality, these rules will dictate explicite

procedures for almost any operational aspect of an automated amateur radio station, including their supplementary services.

For the SysOps participating in this action, such pedantic ruling is inacceptable. Most will rather shut down their automatic stations, esp. the supplementary services than accept these bureaucratic and completely unrealistic rules.
This protest is intended to demonstrate what might happen if the intended decree will become reality.

Currently, the AX25 Packet Radio network in Germany is one of the fastest and most efficient worldwide, although (or rather: because) it does not rely on the internet, but on high-speed radio interlinks on 1.2 GHz and above.

The users of the nodes will be informed about the reasons for this protest and are kindly asked for their support.

The participating SysOps do not want to offend anyone and are apologising for any inconvenience caused by this action to the international Packet Radio community. However, they would like to make it clear that the situation is very serious and that support is needed.

If you want to support us, please consider writing a polite e-mail to the RegTP.
mailto:poststelle@regtp.de
Subject: "Amateur radio service, draft for automated remote-controlled stations".
You might ask not to deteriorate the existing liberal amateur rules for automated stations by installing unnecessary bureaucratic regulation.

You can reach the English language homepage of the German Regulatory Authority for Telecommunications and Posts (RegTP) at http://www.regtp.de/en/index.html

Thank you for your understanding and support.

73
Tom DL3SBB and Uli DK2GO, speaking for about 80 participating SysOps

The difference between APRS and BBS packet, is that the content
is several magnitudes lower in quantity, thus more stations can exist.

Since only moving targets need to update their position, that leaves
many stations that need only broadcast every hour.

But just like everything else, a few Hams can cause problems. Those
Hams that use long strings of digi's, and broadcast their static positions
every couple of seconds, can also be found on 75 meters slobbering
all over themselves to debate the advantages of being a Caucasian.

Well, APRS is intended for telemetry, not chatting. Chatting shouldn't
really be done using anything but the exact path needed, but I don't
think the software available is flexible enough to direct messages
as required.

I wouldn't really agree with that, although I expect attitudes vary from
one part of the world to another, according to the whims of the local
(self-appointed) rule makers. (If this thread has proved one point, it
is that there is little of "doing it for fun" left in packet. Whatever
you do, there's always someone more than ready to tell you that you
shouldn't be doing it!)

UI-View allows you to select the path for individual messages, remembers
the last successful path you used to contact a station, etc.

A 60KHz receiver is possible, of course. One needs to detect the 1pps 10dB signal reductions of the WWVB carrier, then validate and decode the 60-bit word that results into time and date, then set the PC. A 60KHz receiver would likely be dedicated to that function alone since it wouldn't suit any other service (except for NPL's MSF time service in the UK, which uses a different modulation scheme).

Instead, I suggest that you consider decoding the modified IRIG-H code that WWV and WWVH transmit on a 100Hz subcarrier of 5, 10 and 15MHz. Most communications receivers will pass that audio and a sound board could certainly be used to decode it. Again, the data needs to be decoded and assembled into time and date before a machine could be set to it. Unless you are privileged to get a solid WWV signal, you'll have trouble with noise and fades, and you'll need to validate the data you think you've received.

I chose to do the 100Hz detection in hardware. I built a PLL-based 100Hz timecode regenerator for this purpose and I wrote a tool that accepts the 100Hz data via a parallel port pin. The program is called TakeIrig.com; it is supplied with the RighTime evaluation package at www.RighTime.com. A corresponding timecode generator program, MakeIrig.com, can be used to test your setup. These are both DOS-based tools; although they work under Win9x if the data can get to them, Win98 tends to commandeer the ports and often defeats successful use of TakeIrig.

Good luck.

Hi,
Anyone know where I can get a complete description of pactor-II?
If the specs have not been published, is it legal to use?
tia,
KG0T

I am giving you an entirely biased answer...

TMD700A is the radio I mean THE RADIO you should buy. I spent big bucks
for one and liked it so much I went out and bought a used one on ebay
and saved $150 plus tax. It doesn much much more that it advertises.

check out this site and look for the complaints. OKAY some intermod but
what wideband radio doesn't have intermod problems?

For DCF-77 (77.5 KHz), which uses the same modulation (although I think
with fewer dB of reduction), special ICs exist that do everything with only
a ceramic resonator and an antenna (ferrite rod) attached. Serial digital
stream comes out of it, ready to be decoded by a resident program.

This can be found in the $10 alarm clocks I mentioned.

Can't you find something similar in the US?

It looks like most of the WWVB radio clocks, in fact, use 60KHz modules from - or copied from - Germany's Juergans. Some of them do not work well here in Florida, though, because of the distance to Fort Collins, Colorado, the transmitter location. For our office, I built a 60KHz oscillator, driven by a PC that produces the timecode, to keep a wall of radio clocks in sync and on time.

Still looking for the 'perfect' trade on this! Thanks to all who have made offers! I am still considering them!!

Greetings! Up for grabs is an immaculate (I mean TRULY immaculate) Kenwood TS-850SAT. This one didn't look any better when it came out of the box from the factory! I cannot find a scratch, fault, or blemish anywhere on this rig! If you are a Kenwood fan, you already know the features of this competition class, world renowned transceiver! And this one is LOADED with the YK-88C-1 filter, the YG-455C-1 CW Crystal Filter, the VRU-2 Digital Voice Recorder unit, the VS-2 Voice Synthesizer Unit, and the Kenwood IF-232C Computer Interface with all cabling! Also includes the original stock microphone and box in MINT condition! Only thing that shows any wear on this outfit is the manual, and it's not in bad shape at all...schematics included. If you can find a cleaner TS-850SAT out there anywhere, I'll eat my shorts, Hi Hi!!! I would prefer someone within driving/meeting distance on this one, so you can appreciate the true beauty of this one! For those of you not familiar, the Kenwood TS-850SAT is called by many one of the best HF rigs ever manufactured! It CERTAINLY has one of the best receivers of any rig! Includes 160-10 meters (WARC included) with general coverage receiver. Features a great automatic antenna tuner, dual VFO's, dual NB, slope tuning, adjustable AGC, memory 'channels', I could go on and on...look at the product reviews section on www.eham.net for further comments on this great rig! I am really looking to trade this rig...would like at least a KW amplifier with a lower-end rig...something along the lines of an SB-220 in excellent condition with an older rig would suffice. I'll listen to any and all offers. Don't be afraid to bounce an idea off of me! I would also prefer that the deal be completed in person. Anyone in the Chicago or Rockford, IL area interested? How about the Madison or Milwaukee, WI area? E-mail me with any and all offers! Sorry for the length of this post! I don't usually get this wordy but this one's a true beauty! 73 es gud dx de N9LXX~~~ R. Blaine Fox Beloit, WI

From WB4APR's DOS APRS README.1ST:-

****
Think of APRS as just a multi-user distributed packet network with a MAP
display for many exciting amateur applications:

Network topology monitoring
Direction Finding
Weather reporting
Frequency Coordination database
DX cluster monitoring
HF DX plotter
AMSAT ground station tracker
Satellite tracker
Search & Rescue
Special event tracker/organizer
Boat/mobile/RV tracker
RF path estimating
Local area CHAT mode <----------
Telemetry displays <----------
Airline tracking
****

>shouldn't be doing it!)

Yes, this seems to be re-invented by the APRS folks too :-)
Back in the early days of packet there would always be a few stations
beaconing "advisory" texts about parameter settings and behaviour. Or
arguing with stations who were doing "too much" BBS downloading.

However, once we had a decent networking system with distributed access
channels instead of the everyone-on-one-channel system this disappeared.

I was amused to see it back when tracing the crowded APRS channel...

4864. Re: A/D question

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-12-02 00:20:20 UTC
From: Jimmy Hoffa <jimmy@hoffa.org>
Message-ID: <8fXV5.268620$g6.121230567@news2.rdc2.tx.home.com>
Source record: 10046

If you take the minimum and maximum voltage points of a signal,
and divide that by the number of bits, you get the volt/bit value.
The smaller this ratio, the greater the fidelity (spectral purity).

More bits also equates to greater dynamic range (the difference
between the smallest signal, and the largest).

But great things have been done with few bits. Voice for example
can be digitized with 1 bit and this digital value be used to drive a
PC speaker.

Sampling rate also plays an important part. If you can oversample
the input signal, the chances are, that each value won't change much,
and a differential type encoder can be used. Today's computers are
so fast, and A/D's are so fast, that oversampling is quite common
at the audio frequencies, less common in the MHz IF's.

I'm not saying it shouldn't be used for chatting; any activity is welcome.
But I think WB4APR's original intention was telemetry.

> UI-View allows you to select the path for individual messages, remembers
> the last successful path you used to contact a station, etc.

Excellent; sounds like that's exactly what's needed. Your software
is popular down here in VK3 and I recommend it to new APRS users
because it is easy to use, reliable, and inexpensive.

Regards,
Hamish

I just downloaded the soundcard program noted above and really like it.
I am however having one small problem that surely someone has a simple answer for.
After I set all the macros and parameters and want to exit the program, there is no way to exit (that I can find) except to drop it out of Windows and then all the saved information is lost and has to be reset the next time I use the program
There has to be a better way of exiting the program without losing all the presets..
Any suggestions?
Thanks in advance
Dick K9RT

In article <8fXV5.268620$g6.121230567@news2.rdc2.tx.home.com>, Thanks to all. I spoke before i thought. If 12 A/D, dymanic range is 20log(2^12), right? Therefore noise floor of input signal should be below that, right? Also, I have to get a number of samples, FFT them and see that 2nd and 3rd harmonics are lower that 74dbc, meaning input signal has to be at least that good, right? The teat station I'm looking at uses a source with harmonics rated <30bdc, but then they BP filter the heck out of it.

Hi all,

Can anyone give me some feedback on the Ricoh RDC-6000? I live in South Africa and want to purchase this camera from the US. It will be delivered to my family over there who will bring it to me. What I would like to know is this - the camera has a AC adaptor for charging the battery. In South Africa we work on a 220V system and I think the US uses 110V. Will I be able to use the AC adaptor without any troubles?

Many thanks.

What TNC's does LAN-LINK support?

Is Lan-Link shareware?

Look into the 'WinLink' and 'AirMail' web pages. They do connect the
Internet to the Ham Bands in several ways. I have only used it for HF Pactor
to send/receive E-mail through the Internet. The speeds are too slow for
High Speed work. Look into it, however, and, perhaps, they support Packet
VHF at higher speeds.

Is anyone using a Tandy WP-2 on packet?

I can get it to talk to a KPC-3, but canï¿½t save RX text like a Model 100/102.

Any ideas? Thanks!

Michael, N9OGC

4885. Remote Control of VC-H1?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-12-07 02:44:52 UTC
From: abcdef123@my-deja.com
Message-ID: <90mtj3$e8l$1@nnrp1.deja.com>
Source record: 9923

Hi,

Has anyone successfully communicated with their VC-H1 via the COM port on it? According to the manual (p 17-18), it is possible to connect a computer to it via the serial port and then remote control becomes possible. Kenwood provides pinouts for the COM port in a file called connectors.pdf that is available for download at www.kenwood.net.

Using the Kenwood document, I constructed a cable to connect my VC-H1 to my computer. I set the communications parameters as specified on p. 17 of the user manual (9600,8,1,no parity). Other than turning on the LCD screen on the VC-H1, I am not able to get any response from the camera when sending any of the commands listed on p. 18 of the manual to the camera from a terminal emulator. I've tried uppercase and lowercase and varying the communications parameters, but to no avail.

I've also talked to Kenwood support in California and they don't seem to have a clue. Their support person still hasn't called me back as promised after 48 hours have gone by. Unfortunately, I don't speak Japanese or I'd call the company in Japan and cut the fools in California out of the loop.

I have used it with the PK-232 no problem. Make sure that you have
the right baud rate set in the program. Try turning off any
transceiver control options in the software that may be turned on.
Try e-mailing Gary; he is very helpful. RJB.

You didn't say what kind of computer it was. If you can load Windows 3.1 on it, Windows 3.1 comes with a terminal program - and that will be good enough to get you started.

I'm sure there are old DOS-based programs out there that will work. But good luck finding them.

Psssst.... Let me let you in on a little secret - nobody, and I mean NOBODY, uses DOS anymore. If you insist on trying to use that old clunker(again, you didn't say what it was - so I have to assume it is a real clunker - like an XT, or something!), you are not going to get any sympathy from anyone.

If you've got at least a 486 with 16Mb of memory, there is at least hope for the thing - you can put Linux on it! RedHat Linux 6.1, loaded in text-only mode, works great on a 486 with 16Mb! Since most schools won't even bother taking any donated computers that are lower than a Pentium with 32Mb - you should be able to pick up a 486 for about $25, and run Win95 or Linux on it. Do the world a favor - SHIT CAN anything lower than a 486 with 16Mb of memory.

Thanks for all the suggestions regarding XPWare ver 1.28 software. I have concluded the software has problems with the AEA interface. I have tried every possible combination of comm ports, baud rate, data bits, parity and stop bits all to no avail. Have spent hours trying to get the software to communicate with my PK-232MBX running version 7.00 firmware. Even attempted to load a run on a second computer and had no luck on that system either. My computers worked just fine with other multi mode communication software and my PK232. My advise to all people thinking of trying XPWare is not to waste your time with this package.

Send me a copy of the XPWIN.INI file in your windows directory
and I will take a look. XPWIN was orginally written for the PK232 and
works fine with my PK232 and PK900's here on the desk.

Sounds like the parity is set to 7 bits and even parity. Should be 8
data bits 1 stop bits and Parity set to None. Any other setting will
NOT work. Use at least 4800 baud.

4896. PTT in Linux

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-12-11 04:22:03 UTC
From: Jimmy Hoffa <jimmy@hoffa.org>
Message-ID: <LDYY5.13130$x6.7392368@news2.rdc2.tx.home.com>
Source record: 9934

I needed a quick and dirty method of PTT in Linux, for a
repeater controller I am working on, and having never
messed with the low-level stuff in Linux, thought I'd see
if I could decode all the docs.

I looked for Linux repeater controllers using a couple of
search engines, but most were commercial affairs. Didn't
see any hobby pages.

This works, but there's a long way to go :-)

```
/*
* serialport.c
*
* This module controls the RTS pin 5 signal
* of the DB-25, or pin 7 of the DB-9 connector.
*
* The RTS signal is used to control the Push-To-Talk (PTT)
* of a Ham Radio Repeater.
*
* Tested with Caldera Linux 2.2.14
*
* Public Domain (p) December 2000
* Steve Sampson, K5OKC
* No Rights Reserved
*
* Version 1.0 Initial
* Compile with: cc -O -s serialport.c -o serialport
* Must be root user to run.
*/

#include <stdio.h>
#include <sys/io.h> /* glibc */
#include <errno.h>

int port_allocate(int port)
{
unsigned long addr;

if (port < 1 || port > 4)
{
fprintf(stderr, "Serial port must be in the range of 1 and 4\n");
return 0;
}
```

```
switch (port)
{
case 2:
addr = 0x2f8;
break;
case 3:
addr = 0x3e8;
break;
case 4:
addr = 0x2e8;
break;
case 1:
addr = 0x3f8;
}

/* Allow user access to 8 bytes at the specified address */

if (ioperm(addr, (unsigned long) 8, 1) == -1)
{
perror("Serial port not available: ");
return 0;
}

return 1;
}

4897. PTT in Linux

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-12-11 04:24:17 UTC
From: Steve Sampson <k5okc@home.com>
Message-ID: <RFYY5.13138$x6.7400120@news2.rdc2.tx.home.com>
Source record: 9935

I needed a quick and dirty method of PTT in Linux, for a
repeater controller I am working on, and having never
messed with the low-level stuff in Linux, thought I'd see
if I could decode all the docs.

I looked for Linux repeater controllers using a couple of
search engines, but most were commercial affairs. Didn't
see any hobby pages.

This works, but there's a long way to go :-)

```
/*
* serialport.c
*
* This module controls the RTS pin 5 signal
* of the DB-25, or pin 7 of the DB-9 connector.
*
* The RTS signal is used to control the Push-To-Talk (PTT)
* of a Ham Radio Repeater.
*
* Tested with Caldera Linux 2.2.14
*
* Public Domain (p) December 2000
* Steve Sampson, K5OKC
* No Rights Reserved
*
* Version 1.0 Initial
* Compile with: cc -O -s serialport.c -o serialport
* Must be root user to run.
*/

#include <stdio.h>
#include <sys/io.h> /* glibc */
#include <errno.h>

int port_allocate(int port)

This is not the way you do these things under Linux!

Direct fiddling with I/O ports requires root privileges, allows the program
to mess up the entire system, and is nonportable because of all the
hardcoded addresses in the program.

Instead, use the TIOCMBIS and TIOCMBIT ioctls. (bit-set and bit-clear)
Example fragment:

```
#include <stdio.h>
#include <fcntl.h>
#include <termios.h>

{
int fd,arg;
char *portname = "/dev/ttyS0"; /* or whatever */

if ((fd = open(portname,O_RDWR|O_NONBLOCK)) < 0)
{
perror(portname);
exit(1);
}

arg = TIOCM_RTS; /* or TIOCM_DTR */
ioctl(fd,TIOCMBIS,&arg); /* set the line */
ioctl(fd,TIOCMBIC,&arg); /* reset the line */
}
```

It would be portable to any x86 system. I don't know a Ham with a Sparc,
Alpha, or RS/6000, so I'm not concerned too much about architecture
portability :-)

I take note of your "mess up the entire system." I think by that, you mean
that a process could interfere with the port, and I am aware that the serial
port and parallel port must be dedicated on the controller. This 486
controller
will not do anything except control the repeater and process audio through
a soundcard and the ethernet.

> Instead, use the TIOCMBIS and TIOCMBIT ioctls. (bit-set and bit-clear)
> Example fragment:

I appreciate the fragment, and will play around with it. It's early yet, so
options are open. Are there also parallel port bits controlled using this
method?

Steve

It would not work on my system either... I have a plain Pentium system,
but it has a 6-port serial card that brings the total number of COM ports
to 8. These are perfectly accessible as ttyS0..ttyS7 after setting the
port numbers one time in the system startup files.

/dev/ttyS0 at 0x03f8 (irq = 4) is a 16550A
/dev/ttyS1 at 0x02f8 (irq = 3) is a 16550A
/dev/ttyS2 at 0x0220 (irq = 15) is a 16550A
/dev/ttyS3 at 0x0228 (irq = 15) is a 16550A
/dev/ttyS4 at 0x03e8 (irq = 15) is a 16550A
/dev/ttyS5 at 0x02e8 (irq = 15) is a 16550A
/dev/ttyS6 at 0x03e0 (irq = 15) is a 16550A
/dev/ttyS7 at 0x02e0 (irq = 15) is a 16550A

>I take note of your "mess up the entire system." I think by that, you mean

>will not do anything except control the repeater and process audio through
>a soundcard and the ethernet.

Well, of course it will not mess up the system until you do something
wrong. But that is exactly like the situation in Windows. The Linux
kernel tries to protect you from doing things wrong, but it allows a
cut through in case you really need it. You are using this cut through
the protection, but it is not required in that case.

I am using the ttyS6 from the above list for several purposes:

RXD/DCD lines connected to a timestandard receiver (DCF77)
DSR line used as a one-bit input from a motion detector (burglar alarm)
RTS/DTR lines used to shift data into a rotor controller (AMSAT-DL)
TXD line used to control a circuit that drives a coaxial input selector
in front of my R7100

These lines are driven and sensed by 4 separate programs. No problem when
using the ioctls, but I would not dare to do that using direct port access.

The programs are running as a nonprivileged user, just to a chown of the
tty device to the user you want to run the program (or a chmod a+rw). No
need for root privileges.

>> Instead, use the TIOCMBIS and TIOCMBIT ioctls. (bit-set and bit-clear)
>> Example fragment:

>I appreciate the fragment, and will play around with it. It's early yet, so
>options are open. Are there also parallel port bits controlled using this
>method?

I am not an expert on parallel ports, as I use my single parallel port to
drive my printer. All my stuff is hanging off serial ports.

It looks like (nice to have the kernel source!) there is no ioctl to
manipulate printer port bits. What you could do is wire the port in such a
way that the kernel considers it "ready" (some fixed levels on status bits
and probably a wire from the strobe to the ack, maybe needs an inverter).
Then, you can just open the /dev/lp0 for writing, and writing a single byte
will put it on the 8 datalines.

I am looking into setting up a packet station in Brunswick, Georgia.

I have a TR-7950 Kenwood 50 watt transceiver, AEA PK88 TNC and AEA Isopole antenna that I can dedicate to the station. Is there any current activity in this area, and could a link here fill any gaps to help build or restore a network.

I don't have a much packet experience, but have a good understanding of DOS based BBS operation, having run a multinode DOS BBS with up to 250 users on a 5 computer network using 4 dial-up lines for incoming connections.

I could also consider APRS instead. Again, need for a link or node to expand communications in the South East would be my main criteria.

If there is no need, I could still enjoy recreational usage, but don't mind trying to maintain a node or link if it would be beneficial.

Info and direction requested.....

Yes, this looks reasonable. Note that in situations where you want to
manipulate individual lines from several programs it is better to use the
newer TIOCMBIC/TIOCMBIS commands than the TIOCMGET/TIOCMSET used in the
example.

I have no manual but I do have a schematic. There are many jumpers, it
seems best not to touch them. Most are for very specialized purposes.

The DIP switch is used as follows:

1&2 select the base address (4 possible combinations)
3-8 select the IRQ (set only 1 switch to ON for IRQ 9,3,4,5,6,7 resp)

4911. IEEE 802.11b (DSSS) 2.4GHz and Ham Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-12-13 16:03:33 UTC
From: Randy Hoops <RandyHoops@Home.com>
Message-ID: <uj6f3t4ipcac1keebcdfqu0g9km13ru51a@4ax.com>
Source record: 9949

My name is Randy, K0CM, and I was an early adopter of packet in 1985. I ran packet BBS's and set up digi's and nodes. When I started, my phone modem was 300 bps and VHF packet wasd 1200 bps.

My phone modem has gone from 300, to 1200, to 2400 to 9600 to 19,200 to 28.8 to 56K and now I'm using a cable modem that averages 700 kbps.

As far as I know there is no high speed packet in my area. Despite a few attempts at 9600 bps (I wired up three K9NG modems), and someone trying a Kantronics dataradio, we just neve got moving.

I've recently been reading about IEEE 802.11b (DSSS) 2.4GHz links.

These have evolved into something that I had hoped packet radio would have done. Cost is currently under $300 per unit. (Less than most radio - TNC combinations).

Is there any way to adapt these units to ham radio use? Could we modify the RF to go to another band, and raise the power or use directional antennas?

These things are reported to have a range in the hundreds of yards. The top data rate is 11 Mbps.

Would it be possible to build an intercity backbone with a set of modified 802.11b devices?

These use the 2.4 Ghz ISM band and use Direct Sequence Spread Sprectrum techniques.

Here are some manufacturers links:

http://www.linksys.com/products/product.asp?prid=157&grid=19

http://www.3com.com/mobile/wireless/index.html

http://www.dlink.com/products/wireless/

I got out of packet radio because it was just too slow to do anything useful. Speed like this could get me interested again.

Good question but I have these caveats:

1) This may cause intereference to other 2400 MHz amateur operations, such as ATV or interrepeater links. Also, you might be interfering with other users of the same hardware (although interference to them isn't a concern, interference

FROM them may be).

2) These devices normally operate over the ENTIRE part 15 2.4 range (2400-2485 MHz), so without playing with the frequency (as part of the modification), you'll have part of your signal out of band.

3) IF the SS method isn't the one in 47 CFR 97, are you able to figure out what hopping pattern the device is using so that you can submit it to the FCC as required? Most devices don't come with this documented.

4914. Set of great Macros for Digipan?

Hi thanks for reading,

I am using Digipan 1.5, I would like to see what other's are doing for
macros with digipan 1.5.

> informing the regulatory body.
>
Unfortunately it's more than that. Some focus on this point as being the
main cause for the sysops' protest.

Maybe following updated information will give you a closer look on the
problems concerning the draft.

73 de Thomas

Sunday Dec. 10, 2000. Today the majority of the German Packet Radio
Mailboxes (BBS) have been reactivated after being temporarily dis-
connected from the Amateur Radio net as a measure of protest against
the planned 'over regulation" by the German Regulatory Authority for
Telecommunication and Post (RegTP). The SysOPs of the affected BBS
systems have reactivated their services to allow users, which in the
large majority have supported the protest with much sympathy, to
again exchange their views and get additional information regarding
the protest through this system.

Reason for this temporary cease of operation was a draft of a decree
("Amtsblattverfuegung") by the German Regulatory Authority for Tele-
communications and Posts (RegTP).
This draft, among other things, includes very specific and detailed
procedures for almost any operational aspect of an automated amateur
radio station (ARS), including their supplementary services, like
DX-Cluster. Limiting the more liberal and flexible standards of today's
operation.

On Friday, Nov. 24, 2000, as a sign of protest against such overre-
gulation, first sysops in Germany started to temporarily cease
operation and disconnect down interlinks and additional supplementary
services like BBS, DX-Cluster, TCP/IP-based systems and convers-servers.
In the following days the protest received widest support by a growing
number of sysops. Until the end of the first protest week, more than 150
Sysops have joined the group, resulting in a virtual cut-off of vast
regions in Germany from the Packet Radio Network. Only local access
points
where available without routing possibilities, drastically demonstrating
the effects of the new proposed operational procedures of the RegTP.
One of the fastest and closest-meshed packet radio networks of the

world had ceased operation.

A week ago, interlinks, DX-Cluster and convers-servers have been brought back to life. One week later the BBS systems were re-connected to
their appropiate nodes.

The goal of this step is to enable users to get more information regarding the protest, express their opinions and views and freely exchange their mails and bulletins throughout the network.

Many users showed their sympathy for this protest action and wrote to the RegTP and other appropriate authorities in protest. The "Runder Tisch Amateurfunk (RTA)" - "round table amateur radio services" - the democratically legitimated forum of Amateur Radio Associations in Germany, does share our concern as well.

Despite all the protest, the draft of a decree is still not dismissed! A scheduled meeting between the RegTP, the Federal Ministry of Economics and Technology (BMWi) and the RTA, has been postponed by the RegTP to next year.

The most critical point of this draft decree is the definition, that supplementary attachments to ARS like BBS computer systems, modems and network gateways are an integral part of an ARS and therefore require an expressed permission by the RegTP for operation. One of the objectives of the protest was to demonstrate that BBS and other related equipment etc. are not an integral part of an unmanned, ARS. So the ARS was available for local connections, however no interconnect was possible.

Other points of the draft which need change are planned conditions concerning technical specifications and modes of operations.
For example:
- maximum frequency modulation limited to +/- 3 kHz deviation from the center frequency!
- restrictions of German radio amateurs holding a CEPT-Licence Class 2 or less when using OSCARs.
AMSAT-DL has joined the protest and is thinking about returning the German registration of AO-40 and enrol the satellite somewhere else.

The SysOps agree that the RegTP has to regulate our common resource, the limited amount of freqencies. It has to ensure that every radio amateur has free access to the frequencies used by ARS.

We, the SysOps of the German packet radio system, envision and request a network which is liberal and pluralistic and open for new ideas and technologies and a network which can be formed and shaped according the changing needs of their users. If politics demotes sysops to pure 'service providers', then this would be against the idea of a technical-experimental Amateur Radio Service and against a continuing future of one of the fastest and most densely meshed networks in the world.

We thank you for your understanding and hope that the interruption of
PR-networks and BBS message forwarding did not cause too much trouble
in your region. We are grateful for many positive responses received
from radio amateurs abroad and also will take into consideration
the few critical opinions received.

73
Tom DL3SBB and Uli DK2GO,
speaking for more than 150 participating SysOps

Its realy not hard to comply with FCC rules on the packet gateway.
You can always set permissiond for quests and anonymous logins
as well as ampr.org stuff and ax25. You can turn off rf ports from
internet side and allow from rf ports to internet no big deal.

I use tnos bbs and linux OS works well. http://www.lantz.com for
more info on tnos. There is also a list of tnos www bbs gateways there
to try out so you can get a feel for it. Enjoy....

Source record: 9869

Hi,

I understand that in order to receive 200 Hz RTTY etc you can adjust the Variable shift knob on the front panel of the CP-1.

Is there a knob inside the CP-1 that can be adjusted to change the shift of the AFSK tones generated by the CP-1?

I would like to change the AFSK tones generated by the AEA CP-1 Computer Patch for transmission from 170 Hz shift to 200 Hz shift.

73's
Rob

No experience with the CP1, but 170 Hz shift is the standard for RTTY.
Most terminals have filters wide enough that they can copy either 170
Hz or 200 Hz shifts.

It depends on whether you're building a device driver or an
application. There's a pretty good argument that an application
should be used whenever possible, since it decreases the chance
of accidentally crashing the system in driver.

> portability :-)

I'm another ham with an non-x86 machine around (an UltraSPARC 1).

Keep in mind, using hard-coded I/O port addresses is even sometimes
an issue with a well-known hardware platform like the x86, since you're
limited to devices which match the 'basic' configuration.

Suppose someone plugs in a USB->Serial adaptor and has a Linux
driver for it; the hard-coded I/O addresses would not even come close
to working, but IOCTLs would provide support for the new hardware
for free. This is just one example, of course.

So, while platform portability may not be a critical requirement in the
real world (which is dominated by x86), platform-independent techniques
often bring additional advantages.

Source record: 9873

Actually I do have an RS/6000 running AIX 4.3.3 (42T model),
but wouldn't consider it for a repeater controller, as there are
tons of Intel PC boards for free.

I picked up a 486/66 32 Meg Ram, and added a CompactFlash
simulated hard drive. Actually I'm going to replace that with a
200 MHz K6 board that has all the ports on the mother board,
as the I/O board I have with the 486 is a little flaky, and it wouldn't
be able to do vocoder algorithms fast enough. Just wish the K6
board had a sound card built-in as well, but hey, I have 2 of those
laying around.

While I thought the Intel specific port commands to be adequate,
and possibly some use of the parallel port as well, I've since
decided that the serial port signal lines are numerous enough to
do what I need. I really only need three lines: PTT, COR, and
possibly a "keep alive" interrupt. I will use the termio routines.

The first goal of a PTT on COR with a 9 minute ID has been
easily achieved, now comes the hard part...

If the repeater is in a remote site, or is even the least bit of hassle
to access, I'd personally avoid plug-in cards as much as possible,
particularly if the repeater site is subject to large temperature swings.
However, this probably isn't that big of a deal.

There are some really spiffy single-board computers, like the
Advantech PCM-5864, that integrate everything including audio
and a scad of serial ports, but things like this cost real money
(http://www.advantech.com/ in case you're curious).

Sounds like a fun project, in any case.

For the parallel port, you might consider writing a small driver
which provides access to the raw bits, this way you can make
custom use of it and still retain the benefit of having most
of your application in user space.

I heard a rumour that there are TWO versions of Digipan 1.5.

The first version had a bug that changed your PC clock to 24 hours. The second version which was posted to the web site later fixed the bug. (Why it was not called version 1.6 is beyond me).

I suggest you download the program again and reinstall. It is not a big download.

If it solved your problem, please post a message to this thread.

Thanks for the reply.

True, 170 Hz is the standard for RTTY. But I want to use the CP-1 on AMTOR
and PACTOR. 200 Hz is more common on these modes.

I also understand that if you transmit with a 170 Hz shift and the other
station is receiving with 200 Hz shift demod, there is about a 3db penalty.

4945. Sources for radio remote control systems?

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-12-18 18:05:20 UTC
From: Neil Preston <npreston@nospamgeocities.com>

I need an inexpensive source for a simple radio remote control system. We need a keychain-type transmitter and a receiver with a single latched relay output (Push on, push off). 50-100 foot range should be adequate.

Any suggestions?

There is such a program! See GCMWIN at
http://hem.passagen.se/sm3gsj/gcm.htm

GCMWIN is FREEWARE. You can add anything to great circle maps like prefixes
etc.

Also see YPLOG which has exactly this feature!

But I believe that you need to register YPLOG to obtain this feature.

see http://www.nucleus.com/~field/
and in particular http://www.nucleus.com/~field/Azimuth.html

Or www.qsl.net/ve6yp

I made a mistake. YPLOG does not have an AZMUTH map. But VE6YP does have
a GREAT FREEWARE AZMUTH map program for Windows.

See http://www.nucleus.com/~field/
Or www.qsl.net/ve6yp

In particular see http://www.nucleus.com/~field/azmuth/

Like most programs it is a big download. Another GREAT FREEWARE program

I've gotten several interesting replies by e-mail on this thread.
Here's an interesting link:

http://www.gbonline.com/~multiplx/wireless/

I few years ago AC Nielson (the TV ratings folks) (un)-wired up my
town using MMDS/IFTS equipment. The Playboy channel was distributed
this way too. These are roughly 2.4 Ghz, and there were lots of
reflector/dipole antennas around with LNB like electronics.
Presumably many cities have surplus from "Wireless Cable" which
MMDS/IFTS was called.

One question was whether 802.11b is covered under Part 15 or under ISM
rules (Part 18).

Robert Kelly, AC7KE, wrote:

But we couldn't operate that gear on a ham band because the FCC has
authorized only one spreading sequence (that generated by a 7bit
MLLFSR) which differs from that used by IEE802.11b gear.

--
I've got a lot more questions than answers at the moment, but it seems
to me that we could take this equipment, modify it for the ham band,
amplify it, and put it on a well placed antenna and get a line of
sight path of up to 20 miles or so.

Anyone interested?

Was that system abandoned? These days I often read about "Drake 2880"
converters that apparently were on the surplus market a couple of years ago
and "are now all gone". These were also for "MMDS".

Did the company go out of business? Or was it not so successful after all?

Do FRS (Family Radio Service) radios like those at Circuit
City have DTMF? If so just use a couple of radios and a
DTMF decoder. Might have to buy the DTMF kit separately.

AC Nielson had a setup called "Marketmakers" and it was activated here and in one other town. They installed special boxes that were hooked to the phone line and cable TV. They kept a record of everything that was watched and reported it nightly.

The MMDS receiver had a rooftop antenna pointed at a centralized transmitter. This was used so they could insert test commercials periodically. The test commercials were inserted only to cover a specific product. e.g CBS delivered a P&G Charmin commercial, and the locals would see a different P&G Charmin commercial.

People in the "Marketmakers" program displayed a special ID card when they shopped at local markets and what they bought was monitored. I'd say there were several thousand ramdomly selected households in this community of 120,000 people. I was one of them.

After about two or three years they quit, and folded that operation.

I forget the other city where they did this, but we were supposed to be "bellweather" communities that mirrored the demographics of the country as a whole.

Of course, AC Neilson is still around, but they don't do this stuff anymore.

I don't know if the company is out of business, but there was an article in QST a couple of years back about using the Drake 2880 as a 12cm->2m downconverter. My 2.4 [voice] repeater input uses one of these. The article was oriented towards downlinking amateur satellite stuff.

These are pretty wide-banded in that 2.4-2.686 is downshifted. For the stock unit, subtract 2278 MHz to get the downconverted frequency from the original.

Supposedly in one test over ocean water using commercially available
gain antennas but no amps, the lucent (orinoco) cards tested to 57
miles.

It seems fairly common for people to reach several miles using fairly
reasonable antennas (e.g. seattlewireless.net) and no amps.

4958. VC-H1 digital SSTV modes

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-12-19 06:42:30 UTC
From: Cathryn Mataga <cathrynm@junglevision.com>
Message-ID: <3A3F0356.7C9503D7@junglevision.com>
Source record: 9896

Has anyone figured out how the VC-H1+THD7 digital SSTV modes work? That is the super-duper Kenwood only ones. I have an extra 9600 baud receiver kicking around -- and I thought it might be fun to try to maybe use this as a SSTV receiver. Does anyone know anything about these modes at all?

Though maybe I'll just set the MFJ to FM mode and then set it up to show normal SSTV on my website. This seems doable with maybe a couple evenings of farting around with software. I thought that APRS guy was proposing something like this. Did anyone ever agree on a good frequency to use for SSTV on 2m?

Ok, then I understand how a number of converters could end up as surplus.

>Of course, AC Neilson is still around, but they don't do this stuff

Yesterday I heard that a Dutch company is about to buy them. They first
have to sell off other stuff to be able to afford it, though...

I have seen that information about those converters but what I found
interesting is that they appeared as surplus. It looked like
state-of-the-art stuff so I wondered if the technology was abandoned.

All Motorola handhelds come with rebates if purchased before the new year. The MV11C can be picked up for as cheap as $139 including shipping - that's $109 after the rebate! Here is one site that I've bought from before:

http://www.motorolatalkabout.com/radiosplus/businessradio.html

The MV11C is capable of operating on two MURS-compatible frequencies: 154.570 and 154.600. It is a 1W radio, and has a removable antenna.

Unlike FRS, with MURS external antennas are allowed, and you can do digital communications! Also, unlike the Amateur Service, you won't have a bunch of old windbags telling you that it is "illegal" to set up a network of Internet Radio Gateways for our portable laptops/PDAs. Plus, the 2W ERP limit of MURS is a blessing, it will promote frequency reuse - unlike the virtually unrestricted Amateur Service, where multiple blowhards would render standard frequencies useless with their 100W hilltop transmitters(get ready for 'em to squeel!).

MURS is the latest license-free radio service - check it out!

Stewart, I have read your postings in this general area for some time now.

I am consistently amazed that you even bother to list your ham call. I have seldom see an amateur run down amateur radio the way you do, and for such evidently narrow reasons. Most hams tend to follow the FCC regs, like them or not. That should not condemn them to the derogatory discourse that you seem to enjoy inflicting on this and other newgroups.

I guess that I just don't understand . . .

Before you run up the flag in Motorola's behalf, you may want to review the petition for reconsideration they have before the FCC currently to remove the MURS rule from the CFR. The comment period opened today.

There's also a petition to re-instate the 20 WPM morse code tests.

Once the FCC has done something, a reversal has a snow ball's chance
in hell.

I don't understand why you posted this to an Amateur Radio
newsgroup?? Could it be that MURS will only attract white
people? But most of the white people who buy these radios
will only put them in their bomb shelters for possible future use.

I am sure the PRSG would benefit from your positive attitude. They are not quite as optimistic. When you factor in the difference of money backing the requests of Motorola and the request for reinstating 20 WPM, you begin to see where their pessimism originates.

This is an excellent idea and good thinking. This is the kind of thinking needed to improve Ham radio. I'm discussed with the manner of these other replies.

As it is, if we need to try MURS to get a BENEFIT, then that's what we should do. The thought of the 2W limit being a potetial benifit is a wise one. Whether or not this idea plays out successfully or not, it represents the true scientist and inventor. Something I'd like to think is the very nature of Ham Radio. If us Hams can't take the heat we need to fix it. If you love Ham radio (as it is) and you see no need for improvement then fine.

I love Ham Radio and DO see a need for improvment like say, a REAL BENEFIT! Right now the autopatch (reviled by many fogies) is the best thing we've got going! Stick that in you HF hat and smoke it. HF is cool but I'm not into it. If you are, that's OK. I like clear always working communications and certianly don't want to pay a high price for it. If you have too much money invested in Ham equipment then don't come bitching about it. Do something productive. I believe in obeying the law. I also believe the FCC regs may need some upgrading for our benefit. That is up to us. That is what we need to do. If we don't, no one else will. Ham Radio will suffer in it's numbers or die out with it's old gaurd unless we change. Why do you think most new Hams get a 2m HT as their first rig? I think we need to get back to basics while embracing and enhancing new technology. We need communication benefits! It's that simple. That's the whole goal. We need rules. We don't need to be disabled. We need to know that our knowlege of radio and science is nothing without real world benefits. Beyound this we need to care for each other while using these communication benefits. That's the only thing that shall last.

If you don't want to use the Motorolla radios then don't. It was just his suggestion because it is already for MURS frequencys.

As to the idea. Speed will be the gratest problem. 9600 baud (which takes up less spectrum than 1200) would be the cheapest per speed. Rigs would need access to the discriminator or have a (really) 9600 ready rig. It would be worth it to promote 9600 as a *minimum* I think. DSS would be best but not on MURS.

The super cheap might use 2400 or 4800 baud with unmodifided rigs. But at 9600 one might start to think about HTTP. Further the benefit would seem to be only for mobile/portable ops. As the home station could use the regular internet. So your equipment at home could be basic but the mobile needs special consideration. Perhaps your own mobile text (2-

way) pager. It all depends on what your going to accomplish. That's why I say "BENEFITS". Maybe we could get hold of those small 2-way paging type devices with it's own thumb keyboard and email capabilites. Then set it for MURS. Your home computers soundcard can encode/decode 9600 AX25 so why not other protocols. This sure helps in the cost effective area. Once those Palm/CE devices with hi-res color video LCD screens come down from prices around $500 then very interesting wirless benefits come to mind. Modifying low cost equipment seems to be the best solution in todays micro circuit world.

The point is, we must consider the benefits, the costs and if the rules need to be changed accordingly. We definately need the rules that promote sharing but some of the reasoning behind current FCC regulation is outdated. They will not fix it until the Ham community cries foul. So far we've only agued about CW. That is way off target. it doesn't matter. New communication benefits do. What idea's do you have?

How did you arrive at that conclusion?
(9600 baud spectrum usage less than 1200's)

A 9,600 baud signal requires 15.36 kHz of bandwidth (and thus, usually occupies a 20 kHz channel - to include a guard area against adjacent channel overlap). It's just too big for 15 kHz spacing without causing adjacent channel interference.

A 1,200 baud signal is encoded into a voice channel which needs LESS than 15kHz (when including its guard area). At most, it only needs to carry a tone up to 3kHz (audio passband), for which the higher tone used in 1200 baud AFSK easily fits within. That's why such may be spaced 15 kHz apart.

Minimum bandwidth of a digital signal is a question type that appears in the amateur radio question pool (extra class), so there's no excuse for getting this concept wrong.

MURS is not Ham Radio.
Please remove the cross-post.

Everything that MURS might "someday" be able to do is already simple
using Ham Radio. Nothing new or exciting here, just the same stuff
Hams have already done for decades.

The same way he arrived at the idea that MURS (if it ever does come
into existence) has something to do with Ham Radio.

i.e. he is probably a potential reseller of MURS gear trying to
scare up some future business with these spam postings.

> (9600 baud spectrum usage less than 1200's)

Just like 300W light bulbs use less electricity than 100W light bulbs.

Which is one of the reasons the left over Batwing junk is worthless for
MURS.

Legal as Church on Sunday -- so long as you don't mind sharing your
internet gateway with the existing users -- such as your local Mickey
D's drivethru -- and a few thousand other non-technical idiots falling
for this hype.

> Plus, the 2W ERP limit of MURS is a blessing, it will promote frequency

Instead you get unscrupulous dealers trying to dump junk radios to
unqualified nontechnical fools.

> MURS is the latest license-free radio service - check it out!

You might consider reading Part 95 to find little things like the
strange bandwidth limits that rule out most existing Part 90 radios.
Then monitor the five frequencies to find out which flavor burgers you
can order on each one.

That is 1200 baud FSK, not FM/AFSK.

Bob

And 1200 baud is the top speed authorized for 10m for U.S. amateurs. 12m and longer wavelengthed bands have a top speed of 300 baud.

WD6EHR's 9600 handbook lost the bandwidth as 12Khz - actually LESS than a 1200 AFSK signal.

So, who do you trust - the ARRL question pool, or Mike Curtis? I think I trust Mike.

Now - let's get down to the real reason why 1200bps would be a good standard, at least to start with, on MURS. At present, you can't get plug and play radios to work at 9600bps(this is the same reason why 9600 never caught on with most Amateurs!). Besides, even if you mod a voice radio, you'll have to set the TxDelay so high that it won't be worth it. What we need are dedicated VHF data radios(unfortunatly, the inexpesive TEKKs are UHF radios).

Now - let's get down to the real reason why 1200bps would be a good standard, at least to start with, on MURS. At present, you can't get plug and play radios to work at 9600bps(this is the same reason why 9600 never caught on with most Amateurs!). Besides, even if you mod a voice radio, you'll have to set the TxDelay so high that it won't be worth it. What we need are dedicated VHF data radios(unfortunatly, the inexpesive TEKKs are UHF radios).

4981. Kenwood TM-D700: problems with clock and APRS

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-12-21 19:29:25 UTC
From: Steffen Spies <spies@rsg-wolfsburg.de>
Message-ID: <3A425A15.1FA69F05@rsg-wolfsburg.de>
Source record: 9819

Hi,

I gotmy TM-D700 last weekend.
It's working fine except two problems:

- Internal clock: I set the time to 17:45 - after 15 minutes it shows
28:00 - 60 minutes later 29:00 - 60 minutes later 30:00, 31:00 ...
The minutes are counted correct, only the hours-counter is wrong.

- APRS: I setup ARPS and it was working great. I saw different stations
and they saw me. Since today, I'm receiving stations datas, they get
digipeated by my TM-D700, but I don't see them on the screen!
Same settings as before.
I see the datas by watching "P.MON".
But no stations under "LIST".

Does anyone know anything about these problems?

Regards,
Steffen / DO4OSS

Mike Curtis is wrong. Do the required bandwidth computation, and one comes up with 15.36 kHz, which won't fit in a 12 kHz (or 15 kHz) channel.

9,600 + 1.2 x 4,800 = 15,360 - Mathematics does not lie.

Remember that the signalling rate is only 4,800 baud because two bits are encoded per state.

It's more likely that you misread.

I didn't say that this exact question appeared in the pool. The formula is
needed to answer questions that are in the pool.

Same problems here. I bought my first TM-D700E last August and found the
same problem with the internal clock.
I tried resetting the rig several times without any luck. So I sent my rig
to the Kenwood Europe HQ via a local dealer, and
after three and half weeks I finally received a little updated rig, which
works FB. (According to the report, they just checked and
resetted the TNC clock there). - So, take contact with your dealer and ask
them to change your new rig or send it back to Kenwood for
repairs.
I have not observed any problems with receiving APRS-data: both the
APRS-data and DX-Cluster infos are OK on the "screen"

Hi ARi,

thanx for info!

3 1/2 weeks is a terrible long time :(
I will get in contact with my Kenwood dealer!

I wouldn't trust Mike's notes, most of that stuff is bent, spindled, and mutilated to
be about "almost right."

Actually, you can find as many bandwidth formulas as there are books. The best
way is to use a Bessel function chart. But even this is in the eye of the beholder
and whatever acuracy you are crippled with. This entails finding the Modulation
Index (3000/4800 = .625). This is either 4 or 6 sidebands depending on how
good your eyes are or how close you get to 3 kHz deviation, or about
(4 * 3 = 12 kHz). Bessel doesn't lie...

Actually, I e-mailed Mike, and he did say something, that when taken OUT OF CONTEXT, could fit what Stewart tried to say.

Mike said that in empirical measurement, there was negligible signal outside of the center 12 kHz with regard to adjacent voice channel interference, BUT that this negligible amount is still NECESSARY in order to correctly recover the digitally encoded signal. He also gave a different bandwidth function, which yielded a 15.6 (vs. my 15.36) kHz signal for 9600 baud.

The function I used is to find the MINIMUM bandwidth needed to transmit a digital signal of a certain baud and symbol rate. These other bandwidth formulae concentrate on other aspects of the overall transmission. All I need find is that there exists some characteristic for Stewart's assertion to be false to prove that his entire statement is wrong, and I have found such.

Yes, but as I said, that concentrates on a different aspect of the signal. Your formula does not take into consideration the needed data throughput, and transitions per second (4800) is not wholly inclusive in representing that when each transition represents multiple states (not just two).

Remember, I started out by pointing to the general futility of trying to run better than 1200bps without a dedicated data radio(for low TxDelay, and PnP-ability). Even if we can't run 9600bps on MURS, I won't be heartbroken - 1200bps is pretty much good enough for the character-based PDA/laptop applications I'm talking about. Also, 4800bps really isn't that bad, if that is what our "real" limitation is. Also, look on the bright side - there is a lower BER at 4800 vs. 9600. Oh, and 4800bps is good enough to send encoded voice ;^)

But - once again, 1200bps is what should be used at first, anyway - as any old voice radio, such as a $109 Motorola Spirit radio, will be able to do it "right out of the box", "without a license", and without having to worry so much about the interference problems experienced on ARS - what with all the few ludicrous high-power NET/ROM radio-backbone nodes(instead of the obviously better alternative of using more lower-power Internet-backbone nodes - the "cellular" concept).

To get something started, we can use the old ARS TNC technology. But to get the ball really rolling, we'll need to chuck the old ARS TNC technology, in favor of a much cheaper PIC-based RF modem design, and move the software off the TNC into the laptop/PDA. The final icing on the cake will be cheap dedicated data radios capable of 4800bps(a VHF TEKK, if you will).

Some of these formulas are really useless for the intended use. The
Carson's rule (2*(deviation+maxAudio)) is usable if there is a decent
modulation index. However, not very usable with digital signals or
typical NBFM channels used today.

>The best way is to use a Bessel function chart. But even this is in the eye of the
>beholder and whatever acuracy you are crippled with.

Bessel functions are usable when you have a single baseband tone no
matter what modulation index is used, but how do you calculate the
modulation index for such complex waveforms as average speech ?

In any digital signals the result depends on the quality of
premodulation shaping used and bandwidths are often measured at -26 dB
below carrier. Often optimum premodulation shaping can not be used,
since the eye-pattern at the receiving end may be too bad due to
non-optimal receiving filters or receiver and transmitter frequency
tuning error, so a non-optimal premodulation shaping may have to be
used.

Also you have to take into consideration the constellation used
(bits/symbol) and if self-clocking codes (biphase, Manchester etc.)
are used.

So you can not calculate the bandwidth from a very simple formula.

I think you're right here. The G3RUH modem is a complex signal, completely unlike the two-tone modems of lower baud rates.

Since you can assume 3 kHz for the deviation, then the modulation index will go up and down based on the harmonics of the complex instantaneous signal. It is possible to gain a third sideband pair, but the amplitude of this
component is a fraction of the other two sideband components (sorry my battery died on the ole hp-48 calculator) and would be filtered. Paccomm lists a 20 kHz bandwidth at -60 dB, and I think this is about right for 2 sideband pairs which is 19.2 kHz (+/-). This is only a ball-park figure and your comment is below, is correct:

> So you can not calculate the bandwidth from a very simple formula.

Man, my math is getting *real* bad...

Sorry, 4 * 4800 = 19.2 kHz

PacComm uses a 20 kHz at -60 dB bandwidth value in their sales material.

Well let's be clear here. I started this asertion. It was just a sub-point guys. The sub-point purpose was to dispel the myth that one can't or shouldn't use 9600 on VHF. Thank you for all the technical knowlege about exactly how accurate the above statement is but perhaps you (the guy who did it) shouldn't be so quick to berate me. Even if I were wrong (which I never am :)). I believe he said I should have known this from the basic Ham exam. That manner is what my main point is all about.

My main point in the first place is; we need to stop bickering about how much we know and get something (benefical) done. So the detailed technical arguements are only worth our time if they promote a real and cost effective *BENEFIT*. This is why I commend the gentleman for starting this thread and MURS idea. Perhaps we'd share more good ideas if people were not so attacked for giving them up in here. They are in fact gifts. Think about that. You know; synergy is taking differing idea's and putting them together for new combined idea's unavailable elsewhere or own ones own. This IMHO is what makes Ham (or MURS even) enthutiasts great. The innovation of days past is seemingly missing in todays Hams. Haven't you guys ever read about our great historical inventers and the resistance their "new fangled" idea created? We are overdue for or latest contribution folks.

Now, right or wrong (it doesn't matter) I put forth an idea. We were talking about moving away from the old ARS TNC and put the software on the computer using PIC (at the base station I suppose). Well think about the AGW Packet Engine (no PIC). That is, use the cheap soundcards. I think the new version 2000.77 has 1200,4800,9600 and TWO PORTS! So, that component may already exist for us and promote success. Also, all we need now is software of like kind that does our needed protocol. That is, if AX25 isn't successful.

Please, think cost effective benefits people. Expect resistance. Change the rules. Don't break the law. Let's be more open to suggestion in this forum. Except for naysaying, it's not only OK but often even great to be wrong when problem solving. So, what's the problem? What benefit are we trying to achieve? That's how things are invented.

Neither matters much, because the one thing everyone in this thread had
neglected in their research is bothering to read the FCC rules for MURS:

95.632 (b) The authorized bandwidth is 11.25 kHz on frequencies 151.820
MHz,
151.880 MHz and 151.940 MHz. The authorized bandwidth is 12.5 kHz on
frequencies 154.570 and 154.600 kHz.

If they actually read what the FCC has to say about MURS, and about
the status of the MURS service, we would not have this discussion.

It is totally unfit for any type of "cellular networking".

But some folks just want to sell radios ... whether they might
work or not ... so we get the recurrant SPAM about MURS.

In that case you could spend your time building Ham Radio networks,
using currently available 56k (and faster) modems and radios.

You could also help populate the HF network, so we have
bulk transport over long distances.

No, none of the above will run faster or more reliably than the internet.
It will, however, use Ham Radio ... the topic of this newsgroup.

Want to set up a link on HF?
I'm there, on air, ready to go, as are others in this area.
Willing to give it a try?

I don't think you're going to interest the MURS candidates.

The only attraction they have, is the complete freedom of
unrestricted communications. Ham Radio is so restricted
as to be of very little use. While you can have greater
speeds, greater power, etc. You can NOT transmit anything
(of value) over it without losing your license. I think you
have to agree to this advantage before you can understand
their side of the argument.

I think this extension of the CB service (which has existed
defacto anyway) is not going to amount to much. The
two Watts effective power is crippling. But...

...I can see all sorts of uses for a radio service that allows
encryption. In looking at the proposed rules, I don't see a
prohibition on this. Could this be useful to autos, boats, and
18 Wheelers.

Once again, you don't know what you are talking about, and you are being completely negative.

I do NOT sell radios - I simply pointed out that Motorola had a $30 rebate on MURS-capable radios until 1/31/2001. I am trying to provide INFORMATION on how to build an Internet-backboned VHF packet radio network.

What are you so worried about MURS for? Why are you always trying to stifle the spread of information about this new service? Could it be that you are afraid that I'm right?

You were always attacking those of us who wanted to build an Internet-backboned network on ARS, but now that there is a service where the rules clearly allow unrestricted Internet gateways(and there can be no argument), you call it "off-topic". Well, it is still "on-topic", because ARS can STILL be used for Internet gateways using the same equipement as used on MURS. The two are so close in capability that YOU CAN'T SEPERATE THEM.

Here are the major differences between ARS 2m packet and MURS packet:

ARS

License:
Technician exam(with $6 fee)

Max ERP:
1500W

Content:
Non-commercial - what this means is debatable. The conservatives believe that all content must be strictly monitored - and that only "they" can be the judge of what is allowable. Never mind that they allow the buying and selling of amateur equipment. Oh, and never mind that a voice repeaters don't have to be "monitored 24/7" - makeing digital information somehow more "evil" than non-digital. Actually these old PBBS operators just miss being able to play "God".

Antenna Height restrictions:
Virtually none - The ARRL lobby/lawyers are very powerful, and you can "get away with murder".

Maximum speed:
For 2m - 9600bps. In reality, currently 1200bps(you need to run dedicated data radios to get 9600bps with a low TxDelay - currently the only cheap data radio is the TEKK available for UHF/70cm). You can run 56Kbps on 1.25cm/70cm, but the equipment is prohibitively expensive for the common man. You can run much higher speeds on 900Mhz+, but Amateurs (TAPR) are nowhere near implementing their own solution, and besides, the range/usability of these devices and converted Part 15 type devices

is apparently "lousy".

MURS

License:
None required

Max ERP:
2W(better for cellular)

Content:
Virtually unrestricted. No "Gods".

Antenna Height restrictions:
Mainly limited to Municipal/CCR height restrictions. In flat/urban
areas, it is better for the cellular concept that this is the case.
Howver, in rural/hilly areas this is a negative vs. ARS.

Maximum speed:
Apparently 4800bps. In reality, currently 1200bps.

the range/usability of these devices and converted Part 15 type devices
is apparently "lousy".

MURS

License:
None required

Max ERP:
2W(better for cellular). Blowhards can't "ruin" a channel over a
100 mile radius, as typically occurs on ARS.

Content:
Virtually unrestricted. Stock quotes, e-mail, newsgroup access,
chat, FTP, Telnet, unrestricted commercial content. No "Gods".

Antenna Height restrictions:
Mainly limited to Municipal/CCR height restrictions. In flat/urban areas, it is better for the cellular concept that this is the case. Howver, in rural/hilly areas this is a negative vs. ARS.

Maximum speed:
Apparently 4800bps. In reality, currently 1200bps. For character-based laptop/PDA portable applications, 1200bps is good enough.

Actually, the maximum speed in the FCC ARS rules is 19.6bps for 2m (and 6m and 125cm). 19.2Kb is the closest, standard speed from a serial port. 56Kb is NOT authorized on 125cm.

You complain about us not knowing the new MURS rules. Why don't you know the ARS rules?

On the other hand, you have only very few channels available so you don't
need many local blowhards to ruin your entire band!

Dear Stewart:

Have you ever heard of "2.5G" and "3G" ?

While you're happily comparing MURS to Amateur Radio Service in your biased
and subjective way (well, it's true), you're fixated on the "hobbyist" approach
and completely ignoring what is happening in the real world.

"Consumer" wireless data is already well-ahead of what you're proposing,
and on a fast-track to major expansion. Are you aware of the deal between
NTT Docomo and ATT Wireless? Have you ever heard of i-mode?

Have you ever heard of Research In Motion? Are you aware of the recent
CDMA license taken out by RIM? Do you know what Mobitex is?

Do you know what Java is? Have you heard of Java 2 Micro Edition? Does
the Mobile Information Device Profile ring a bell?

How do you propose to pay for "RF Internet Gateways" in the MURS context?

I think you're making a lot of noise about essentially nothing.

Happy Holidays, though!

I was wondering when someone would assert that. The concept
doesn't make much sense to me either. You just can't
expect to do something like this with so few frequencies and
no dedicated frequencies. It's sort of like assuming you could
create an analog cellular network on CB and have it work despite
all the other users.

Yes - stuff doesn't work worth crap at those frequencies without dish antennas. For portable applications, you'll be lucky to get much more than 500yard range without dishes. Feedline losses are IMMENSE, so you'll have to pay a pretty penny to get your antenna up high - or you could put your radios in NEMA boxes on towers!

VHF is the best. Low frequency UHF is next best(FRS/GMRS would have been pretty good for this - if the FCC had allowed digital, as in MURS). Anything above 900Mhz is basically for building in-plant, in-house networks.

HF is for the birds.

Look, all this stuff is so much hot air. High speed wireless(with a decent range) is basically on hold until the FCC can work out the conversion of TV channels 60-69(low frequency UHF), and auction it off for billions of dollars - but this could take YEARS!

Besides, all this stuff costs money. There is a recession coming, and folks are gonna want a cheap way to "do wireless". Those folks that can get away with character-based applications on their laptops/PDAs do not need to pay so much money. The trick is to create the applications and infrastructure.

> How do you propose to pay for "RF Internet Gateways" in the MURS context?

Linux boxes are basically free, and many people already have Cable Modem or DSL connections - even a NetZero(free) connection will do. All you need is a $109 radio, a $40 surplus TNC, and maybe an antenna and feedline if you're not on a hill.

> I think you're making a lot of noise about essentially nothing.

I never complained.

> Why don't you know the ARS rules?

HAH! 56kbps IS ALLOWED ON 1.25cm!! AND, IT IS BEING USED ALL THE TIME BY THOSE THAT ARE IN THE KNOW!

As far as me stating that the maximum speed on ARS as being 9.6Kbps - that IS the fastest speed that anyone really ever used on 2m, and you KNOW it - nevermind what the rules say! Anyway - I know the rules better than you, as you just proved by sticking your foot in your mouth about 1.25cm.

Besides being illegal to do phone patches on 11m, 29Mhz is for the
birds - too much skip, and too many yahoos running converted ham HF

amplifiers.

"Come up to where the flavor is" on VHF.

This, of course, could be a problem. As these were itinerant business channels, existing users should be more prevalent in commercial areas; mall security guards, for example. The applications I speak of will be more prevalent in suburban areas. As far as the McDonald's ordering usage - it looks like they will be "moving on" - they can afford a wired connection, or Part 15 devices(more applicable to this application).

Sure, it is only 5 measly frequencies - but it is a start!

5009. interfacing a sound card to the radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-12-22 23:52:32 UTC
From: wf3h@ptd.net
Message-ID: <3a43e710.9022969@news.ptdprolog.net>
Source record: 9846

Well, lightening took my venerable PK232 to heaven, so now, after a period of mourning and grief, it's time to move on.

I'd like to interface my soundcard to the radio. This, along with the appropriate software, will allow me to do rtty, pactor, psk31, etc. I understand audio in/out for the rig/card, but what about PTT?? How do I interface the computer to the rig for PTT control?

Thanks, all, and have a good holiday....

Bob/WF3H

Take a look at:

http://www.packetradio.com/psk31.htm

He's got a whole slew of diagrams...

Hi,

Welcome to the wonderful world of the sound card digital modes. With the sound card, you can do RTTY, PSK31, PSK64F, FSK31, Feld-Hell, PSK-Hell, THROB, MFSK, SSTV, HF and VHF packet!!

But unless you can find a copy of RITTY version 2.38 on the internet, you will not be able to do PACTOR with your sound card. RITTY 2.38 is one of the few programs for PACTOR and a sound card. (It really needs a TRUE Sound Blaster card. Most clones do NOT work). I do not know whether K6STI still sells licences for this version. The latest version of RITTY (Version 4) only supports RTTY.

If you still want to go on AMTOR/Pactor, it may be a good idea to resurrect your PK-232 or buy another one off EBAY. (Personally I would not recommend a KAM for PACTOR).

As for the PTT control circuit, see www.qsl.net/wm2u
It is a simple one transistor, one diode and one resistor circuit.

To interface the sound card to the radio, splice an audio isolation transformer from radio shack into each cable. The cable from your sound card output may also need a 5K resistor to reduce the level enough (the Control panel in windows won't do a good enough job). (see wm2u) Total cost $15 US tops.

Please note that most sound card programs need at least a Pentium 166 MHz computer or better.

I stand corrected that is could take YEARS! I just went to the FCC WTB
site, and they are going to auction these freqs off in March! I guess
the USA finally got tired of watching Europe and Japan kick our asses
in this area, and FINALLY did something. I wonder how much they had
to "pay off" the existing TV station owners?

This is still true, and I think there still are mobile laptop/PDA
character-based applications for MURS. Even 700Mhz will present range
problems - and these companies that win the auctions will need to be
putting up many, many towers... MY GOD! can you imagine the number of
cell towers out there increasing in number by 50% in the next few
years! Besides, these services aren't going to be cheap.

Oh Yes, I forgot to add that many HAMs do NOT even use a PTT circuit. They just use VOX. VOX works great on almost all the digital modes (except for PACTOR and packet)

All you need are two audio cables, a couple of audio isolation transfomers from Radio Shack and a resistor!

So, in other words, you haven't heard of "2.5G" and "3G". Hint: I'm
not talking about frequency bands here.

Do you *really* mean to say that 900MHz+ is useless for wide-area
networking? Do you *really* believe this?

> HF is for the birds.

HF is not really the right choice for wide-area data networks.

Ah. Now we're getting to the bottom of your "vision". Wireless data services very cheaply.

How are applications and infrastructure created for free? Are you going to develop and deploy it out of the goodness of your heart?

How is the infrastructure operated for free?

> > How do you propose to pay for "RF Internet Gateways" in the MURS

So, $150 gets a radio and a TNC (which, by the way, aren't really suitable for your PDA users). How much does the broadband connection cost? Are you suggesting that people will voluntarily ante up their broadband connection to wireless freeloaders? Never mind that this is likely to some people kicked off of their broadband connections (ever read the terms of service on these things?) and I'm not all that sure that the NetZero service is easy to gateway.

Again, would please explain how this is all paid for?

> > I think you're making a lot of noise about essentially nothing.
>
> and you aren't?

Nope. Do you know about Ricochet ? Do you know about PocketNet?

I'm not making noise about essentially nothing. You can sign up for RIM Blackberry service today, it's well-deployed in the USA. You can sign up for
a number of commercially-supported data services that already exceed the

1200baud half-dupled throughput you propose.

My GSM phone works in the USA, Europe and Asia, and provides reliable
9600 baud data connection as well, and it fits in my shirt pocket. That's
not at all like lugging an HT, a TNC, and a power supply around and hoping
I'm near enough a volunteer network operator.

Hmmmmmmmm. Well said.

Some people just love paying monthly charges for things like cell phone
that don't work well. I don't care to promote robber-barons myself. To
each his own. I just wish that was understood by all in here.

Like I said. We should be able to put forth ideas with out CONDEMING
negitive and useless comment. Try to say your point without being
destructive people.

What's interesting is the volume of posts here suggest were on to
something. People have to be on board when it comes to communication.

New frequencies aren't necessarily required; existing 1900MHz PCS
allocations are likely to be plenty of bandwidth, the issue is building
out more network capacity (smaller cells).

2.5G - (GPRS) is already in deployment though it typically only
offers 20kbit/s as a matter of network bandwidth allocation.
It's early deployment, yes, but it is in deployment.

A friend in the radio site business recently remarked to me that all of the wireless operators are building out ten times the necessary radio site capacity at the moment. They're ready for data services...

Cheap is relative, and it is likely we'll see subsidized models of services.

At one time, cellular telephony was not cheap, and now it's like dirt, even with subsidized handsets.

That use would be a violation of the NetZero TOS.
In fact, it would violate the TOS or AUP of almost all ISPs.
The exception: the reseller based ISPs. Plenty of them, but
the cost is not cheap for the number of users this "hyperMURS"
would need to service.

But why is this crap in a Ham Radio newsgroup anyway?

Because Stewart keeps trying to drum up his brainchild in the
closest suitable forum he can find ?

However, the issue with TOS/AUP of ISPs applies to amateur
radio networking as well, so perhaps this isn't "crap".

[BTW - Had a great visit to the Santa Maria Valley yesterday, tasted
a couple of superb Pinot Noirs and an intriguing Cabernet Franc]

If the goal is to somehow push internet connections across
ham radio ... but why would anyone want to do that? It's silly.

Once i-mode is deployed (and I'm betting that will happen fairly
rapidly now ... note all the interesting merger/cross-licensing/etc.
activity going on) then the whole MURS thing is moot.

Sounds excellent!

Used up another bottle of my Lambert Bridge this week ...
... goes well with T-bone ... just about out now :-)

Agreed; but, at least it's relevant to amateur radio. I'm still
scratching my head what Stewart is talking about when he
says "text-mode applications". HDML/WAP is already available
and most folks are yawning. Stewart - if you're reading this,
please comment on what you know about WAP.

I think the MURS thing is already less than irrelevant, but you're right
that i-mode promises to have a huge impact on the American market.

Well, you know, the usual text-mode internet protocols:
smtp, pop, http, et al. Why we don't use pop/smtp over PACTOR-II
has always been a mystery to me.

But I think he means "not suitable for pictures, sound, or video",
unlike ham radio where we Hams have been transmitting and
receiving those things for many many years, even on HF (grin).

Um. Yes. Is getting to be that time of evening :-)

White here. Probably local Chard ... Autumn Wind.
Friends daughter / son-in-law are growers near here, they just
bought out that little family winery, so this will be one of the
last bottles under the old label.

5030. PR: Pacterm '98 and PkTerm '99 1.5 Preview released

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-12-23 05:19:01 UTC
From: Rick Ruhl <ricker@cssincorp.com>
Message-ID: <vGW06.11802$Y53.154700@e420r-atl2.usenetserver.com>
Source record: 9968

Press Release

PacTerm '98 and PKTerm '99 version 1.5 Preview released
Muscle Shoals, Alabama. December 22, 2000: Creative Services Software has announced that they have released PacTerm '98 and PKTerm '99 version 1.5 in Preview. This latest update supports the hot new digital mode PSK-31 as well as the AGW Packet Engine. This is the first product to integrate DSP sound card technology in conjunction with TNC technology. This release is a FREE upgrade for owners of the current product and users who purchase the product today.

The popular TNC program, written in C++, has been available since November 1997.

Company President Rick Ruhl, W4PC said, " We decided to release version 1.5 in Preview to allow the ham community start using PSK-31 with their TNCs, and to get input from them on challenges they find with the program. A Preview version of a product is a product that has gone through internal testing and some beta testing, but may still have some outstanding issues. Hams are pros when it comes to finding issues in a software product, and we welcome their findings".

New enhancements for version 1.5 include:

- PSK-31 sound card support, using the TNC's keying circuit or the TNC's serial port for keying the radio with RTS or DTR, saving a serial port for other functions!!!
- AGW Packet Engine for sound card packet support
- Voice DX spot announcements
- Support for 2 simultaneous TNCs (1 multimode and 1 packet)
- Point and click settings for TNC commands for startup
- Startup/Shutdown commands for each call sign
- 10 mode-specific macros in addition to 10 global macros for each call sign
- CQ, ID and QRT macros
- Pactor connected station call sign display in title bar
- 4K chat and macro buffer
- Support for Satellite Telemetry with the DSP-1232 and DSP-2232
- YAPP and PC-PakRatt binary file transfer support in Pactor or GTOR

And includes supports that the previous versions had:
• Macro Variables {CALL}, {UTCTIME} etc
• ASCII transfer for UNPROTO mode in Packet
• Multiple file select for ASCII transfers in HF
• Abort ASCII file transfer now available from HF
• Interoperability with Log Windows, DX4Win 4.06 and Logic 5 logging programs

- Basic radio control interface
- Added FIG/NUMS menu option in PKTerm
- Additional commands specific for the PK-900 and DSP-2232 in PKTerm
- Multi-stream multi-port support. Up to 26 streams per packet port, each in a different window
- Supports G-TOR and G-TOR Monitoring (Kantronics)
- Switch between streams with a click of the mouse
- Text and binary file transfers with YAPP
- Supports COM1 to COM35 (including USB serial converters)
- User defined colors and fonts!
- User defined macros!
- Separate window for non packet HF modes, from CW through NavTex at the click of a mouse
- Save QSOs to a file that is compatible with Microsoft Word
- Multiple monitor windows allow you to watch traffic on each radio port

The program runs under Windows 95/98/Me and Windows NT/2000. It is a true 32-bit Windows application, designed using the Windows Style Guidelines available from Microsoft.

PacTerm '98 and PKTerm '99 are $79.95. They are available directly from Creative Services Software or your favorite dealer. You can also download the program in demo mode from the CSS web site.

Creative Services Software is at http://www.cssincorp.com.

Windows, Windows 95, Windows 98, Windows NT and Windows 2000 are Registered Trademarks of Microsoft Corporation.

Since the Amateur Service is so inappropriate and stifling for this new development and effort, why is it under discussion here on rec.radio.AMATEUR.digital.misc?

Wouldn't a new newsgroup unfettered with the Old Fart amateur service element be much more attuned to all this?

Who will take the lead?

72/73, George W5YR - the Yellow Rose of Texas NETXQRP 6
Fairview, TX 30 mi NE Dallas in Collin county QRP-L 1373
Amateur Radio W5YR, in the 55th year and it just keeps getting better!

Well if you want to get picky then this post of yours doesn't belong in this group. Who said it was a fight between MURS and ARS anyway. I'm looking for benefits. I love ARS and the benefits it does have. If it were not in need of new and more real world benefits then I wouldn't say anything.

We're all big boys and girls. Lets face facts. What does MURS have that ARS needs? If you're so proud of being an "Old Fart" then you know why you dislike the discussion. :)

So far were looking at digital modes to provide real benefits whether on ARS or MURS. Much ARS hardware can be used on MURS. Also maybe we can update ARS to specifically alow some HTTP.

Maybe we can get digital privileges on FRS so we can use good $20 FRS tranceivers. Maybe if we set up a FRS network the FCC would approve it. Once they got over the shock we Hams were actually doing something useful.

Can't we all just get along? LOL

How about a device that reads your email out loud in the car? One that lets you type back (when stopped). It seems to carry my criteria being of being cost-effective and benefical. Hey! Zero cents a minute. All incomming minutes free. No monthly fee.

Ideas people! That's what we need, brainstorming.

73

P.S. All great innovators meet with resistance. It is change that makes us uncomfortable for it shows the truth. We are not in control. God is. We don't know all there is to know. God does. Our will has limits in reality. God doesn't. Although, he does not change. Truth is not relative, we are. We just feel better with our false sense of reality. But that's OK. We will soon see. For better or worse.

Jesus is the risen Holy Spirit of God. He came to earth to pay for our stuborn self-will so we may know him and his love, joy, peace, patience, kindness, goodness, faithfulness, gentleness and self-control. Only the diety of Jesus paid for you to be with His good perfection and know his love and plan for your life. He is the perfect one. He only wants good for us. Therefore Jesus and not our own deeds are the *only* just payment for friendship with Him. He entends love in Christ. This life is our short time to accept His will over ours. Do you know His love and plan for your life?

Merry, merry Christmas,

HF packet using 300 bps FSK might be obselete. Have you tried
Q15X25 AKA NEWQPSK though? OH2BNS has implemented an AX.25
soundcard modem for Linux which uses this modulation. Pretty cool.

How do we pay for it.

We lose the "toll-bridge" idea and use the equipment we already have. A Pentuim or better computer with soundcard for $55 and up.

Make our own antennas. Design it so the always on home users participate in passing data. That way if the guy next door is down it goes next door. It could then be low power.

Get people on board with real communication benefits. Make it full-duplex.

Use $20 FRS rigs.

Make it as fast as commercial robber-barrons at no charge. Hey mabey we could put the crappy phone company out of business.

USE MODIFIED equipment. Like the wireless LANs for EXAMPLE. Use modified small mobile devices. perhaps PIC could help.

I don't know. Do you think it's possible to build somthing new? Why do you promote the staus quo? Could it have to do with your paycheck? Can't we state ideas whether right or wrong in order to synergize and get something happening?

How is Linux created for free?

Can you pass some of you vast knowlege about new systems and how they work or are you under a gag order? If you think in ARS are behind (we are) then why don't you help out?

The begining of knowlege is knowing you don't know everything. Next is knowing what you think you do know is limited in perspective. Third is knowing knowlege isn't everything and these apply to all mankind.

Merry Christmas.

Hello Cathryn,

that Kenwood SSTV mode is not digital at all, only very fast and
bandwidth
hungry in FM analog. In Europe we are using 144,500 MHz mostly in FM for
SSTV analog...

That's just one part of the equation. How do you pay for the actual
network bandwidth as time goes on?

> Make our own antennas. Design it so the always on home users

> duplex.

Why would you make it full-duplex?

> Use $20 FRS rigs.

Why? How does this actually help? The FRS radio alone is just
a narrow-band FM radio with no data capabilities. What do you use
for a modem?

> Make it as fast as commercial robber-barrons at no charge. Hey mabey
we
> could put the crappy phone company out of business.

How exactly do you plan to do this on the cheap?

> USE MODIFIED equipment. Like the wireless LANs for EXAMPLE. Use

> get something happening?

Of course I think it is possible to build something new,that's
exactly what I've been talking about. You're welcome to state

ideas, obviously, and so am I. Stewart's idea for MURS-based
wide-area data service fails even the grossest sanity check, that's
my idea. Your suggestions fall short of even that. Put the phone
company out of business? Build a high-speed wide-area data network
for free?

Why do ask about my paycheck? Are you intent on impeaching my motives?
Here's a clue: mobile wireless data is already a large market. I'm
not making up names when I mention Research In Motion, Cingular,
NTT Docomo, GSM, Sprint, Palm.Net.

For starters, have a look at http://www.AnywhereYouGo.com/

I have no ulterior motives, I can just tell when I see a
half-baked idea, and that's just me freely sharing my own
opinion.

> How is Linux created for free?

Ah, the Open Source concept. It's not a business, it's a religion.
Have you looked lately to see what's happened to the Linux-oriented
businesses? The Linux/open source "movement" does not create a
sustainable business model by itself; in the near term, Linux
is being subsidized by large hardware manufacturers, but, in the
longer term, everyone will wake up and realize that the emperor
has no clothes. It's simple ludicrous to expect professional
developers to give away the fruit of their labor forever.

> Can you pass some of you vast knowlege about new systems and how they
> work or are you under a gag order? If you think in ARS are behind (we
> are) then why don't you help out?

Gag order? Don't be silly. 2.5G and 3G are all the rage, as you'll
find out if you invest even 5 minutes in a web search to educate
yourself. AnywhereYouGo.com is an excellent jumping-off place.
Have fun.

Here's how I'm helping out - I'm offering you a series of objective
sanity checks completely for free: MURS is not the ARS, MURS will
not support a wide-band deployment. Even Stewart promotes MURS
as an alternative to ARS only to avoid content restriction and tap
into lower-cost consumer equipment.

> The begining of knowlege is knowing you don't know everything. Next is
> knowing what you think you do know is limited in perspective. Third is
> knowing knowlege isn't everything and these apply to all mankind.

Forgive me, but it's stunningly ironic that you write this, apparently
aimed at me.

I'm fairly aware of what I don't know, and I'm quite aware of the
dangers of limited perspective, exactly what I was trying to help
you with.

Something else: if you want to gain even a modicum of credibility,
drop the anonymous Deja posting. Stand up and associate an identity
with your words; I'm left thinking you're ashamed to associate your
reputation with your ludicrous assertions, and I'm not surprised
you seem to lash out at my motives when yours are hidden behind
an anonymous identity.

> Merry Christmas.

Hey, thanks. I didn't know that. Yeah, what we, US-ians need is something
like your 144.500 (Note period, not comma, hehe) channel for SSTV. I'm not sure
what 144.500 is used for the US. The bizarre and mostly useless ARRL
2m band plan shows 144.50-144.60 for 'Linear Translator inputs' and 144.30-
144.50 for OSCAR. Has anyone ever built a terrestrial linear translator on
2m? So, I have no clue whether 144.50 would be available
in this country. Are there any satellites that use 144.30-144.50?

Are there any actual measurements on how much bandwidth the Kenwood-only
FM SSTV modes use? I've put out some feelers with the local guys here to
get a channel setup for SSTV on 430Mhz range. (NCPA mailing list on
qth.net) Will 20Khz spacing be enough?

> BY THOSE THAT ARE IN THE KNOW!

Exactly where (frequency)? There isn't enough bandwidth in the 222-225 segment without interfering with the other allowed modes (weak signal & repeaters). No one has been permitted into the 219 segment due to intereference issues with the primary licensee of that segment. If it is in fact being used, it's certainly not coordinated (and for the 219 MHz segment, coordination is required for the transmission to be legal).

> As far as me stating that the maximum speed on ARS as being 9.6Kbps -

Just because the fastest that anyone used in this area is 9600 doesn't mean
that 19.2 isn't allowed.

A regression of software technology of wireless, non-commercial TCP/IP to KA9Q's original "net" program. Forget JNOS. Forget TNOS. Forget any graphical interface. He needs a platform whereby he can use his original 1981 IBM-PC, complete with 10 Mb hard drive and monochrome monitor.

(Or at least, that's the only thing that makes sense concerning Stewart.)

Actually helical and yagi work very well. Then there is also notch and patch style antennas.

>antennas. For portable applications, you'll be lucky to get much more
>than 500yard range without dishes. Feedline losses are IMMENSE, so

You must mean both ends being portable, right? Because with one end fixed you can get MILES to an almost invisible antenna (think GPS).

>you'll have to pay a pretty penny to get your antenna up high - or you
>could put your radios in NEMA boxes on towers!

That's actually pretty close to what they are doing. Radio and router near or at the antenna. Then you just need a data cable going down.

>MURS). Anything above 900Mhz is basically for building in-plant, in-
>house networks.

You are hilarious. http://www.seattlewireless.net/ and a dozen other similar projects around the world mock you.

>Look, all this stuff is so much hot air. High speed wireless(with a
>decent range) is basically on hold until the FCC can work out the

Think again. How many miles does it take to make "decent" ?

>Besides, all this stuff costs money. There is a recession coming, and

That's for sure. 11mbit(peak) 802.11b runs about $200 per node plus the computer and probably a bigger antenna.

>Linux boxes are basically free, and many people already have Cable
>Modem or DSL connections - even a NetZero(free) connection will do.
>All you need is a $109 radio, a $40 surplus TNC, and maybe an antenna

1200 baud done with cobbled-together HTs *might* have been considered innovation in 1980. That was 20 years ago. Stewart's proposal is not innovative in any way. It is as simple as that. I'm not uncomfortable saying this at all.

Another truism is that "those that do not study history are doomed to repeat it". If you're interested in studying history relevant to wide-area digital communications, one place to look is http://www.etsi.org./

Sign up; download a bushel of the GSM specifications and figure out how to read them, then read them. Start with GSM 01.04, or at least keep it handy. Work through the existing deployment specs and then branch into 2.5G - GPRS - and the follow-on 3GPP specs, which are works in progress.

Understand what the professionals are doing before purporting to have a better solution.

This is cheap; ETSI makes these specs available for download without charge. There are books that demystify it all, but they cost money (argh! imagine that! people expecting value for their work!).

> We are not in control. God is.

I wonder if Mr. Anonymous actually has a wireless telephone.

> Monthly charges? Cell phone that doesn't work well?

I'll bet Mr. Anonymous doesn't know about pre-paid wireless
service. I prefer to pay a monthly charge (versus pre-paid) because
I get more value that way.

Even my GSM phone finds service almost everywhere I travel inside
the US, and does even better outside the US ;-)

> How far have you got behind in the US?

The USA *is* "third-world" in terms of wireless communications, but
it's not as bad as our anonymous friend would lead you to believe. We're
actually quite innovative in terms of "flat-rate" billing plans, something
that my European wireless operator friends would be happy to remain
uniquely American.

My wife is quite happy with her single-band (USA) Nokia 5190, which
was handed to her for "free", and the 1250 minutes of no-roaming, no-long
distance (in the USA) service every month for less than $50 is good.
Further,
she's an avid SMS user - oh, she gets 300 outbound (mobile-originated) SMS
messages a month for $5. Unlimited inbound (mobile-terminated) SMS
messages, too.

My wife would not even find it an amusing joke if I offered her an HT with a
TNC hanging off of it as a replacement for her 5190.

I travel outside the USA often enough that the sleek little Nokia 8890
caught me eye; the international roaming rates are not cheap, but the
availability can't be beat.

It's not that bleak; 3G promises to be the 'catch-up' cycle for the USA.
We'll let the Europeans figure it out, then we'll deploy it. We're such
Americans, after all.

Everyone in my office has pagers and cell phones that beep
and signal their owner every couple of minutes.

I had a cell phone once when I was in the USAF so I could
be mobile while on alert, but since then have been using my
old rotary phone from 1972.

My feelings about all this, is that it is a complete waste of
money. Looking closer at the pagers I see that they have
all sorts of messages from AP, MSNBC, etc, etc. Hardly
anything work related. Mostly expensive toys. I don't
have them, and my pay is the same or greater, and I get
my work done in a timely manner. If it would increase my
pay 25% to have one, then I'd be interested.

Like the farmer said watching the yuppie jog: "What a
complete waste of time, eh?"

there are others growing all the time.

almost all of the wireless wide area networks are based on 802.11b hardware.

I have some input on this.

I stated a 1.6 Mbps (pseudo full-duplex) network link in
Oklahoma City (Proxim Range-Lan stuff). It served us
faithfully for over two years. Mostly weather related problems
such as Ice and water ingestion.

The object was to go from the ISP to my house, and then off
to another house. Each of these "nodes" would then have a
360 degree coverage Symphony network for local neighborhood
LAN's.

Prices have actually gone up on just about everything except
the radios. We got two of the nodes up, but could not find
a link mid-way to the ISP.

The bottom line was, that we could not get anyone else to
join the network. They would join if I bought everything and
hooked it all up and maintained it, but the bottom fell out when
there were no customers interested. Now that I have taken
the equipment down and replaced it with Ham stuff, I am back
to where I started--hobby radio :-)

Rob

Maybe I should have said the first U.S. based 'Host Mode' commerical application. I stand corrected.

RCKRTTY does suppport TNCs, execpt it only supports the WA8DED host mode on the PTC-II and the HAL DXP-38. It doesn't support the host mode on the Kantonics or AEA/Timewave line.

We support the Kantronics and AEA/Timewave line in host mode, which does allow us to use the TNC for keying in PSK-31.

RCKRTTY is a fine shareware product. Most of the time, the shareware product is supported by a single person (the author) out of his home. With a commerial products like ours, a staff that allows sales, support and development is a much better value for the end user, since we can focus our efforts between people instead of one person sharing all responsibilty. And we can provide the dealers a revenue stream, by them being able to resell it.

With the ham market so small, we're trying to help the dealers stay in business and let the ham community benifit from keeping the ham economy strong.

Has anyone used the FT-990 interfaced to a sound card? (I can't download from rec.radio.amateur.digital, so I hope this newsgroup is not too far off topic).

My FT-990 has an accessory jack on the rear marked RTTY. It appears to be ideal (pins 1-4): Shift RX Out PTT and Gnd. The "Rx Out" is fixed volume at 100 mV.

Can I just wire these direct to Shift-->Line Out, and RxOut-->Line In ? Shouldn't need attenuation? And either use VOX for PTT, or run a line from the Com2 to "PTT".... do I need a transistor driver? Thanks, David AC4BN

5076. Log File Export from XPWIN?

I don't have an FT-990, but that RTTY input sounds to me suspiciously like an FSK input, i.e. the "shift" pin is probably not an audio input, but rather an FSK keying line (if so, grounding that pin would shift the transmitted carrier by 170 Hz). Try the "packet" accessory input instead. It was probably designed for AFSK, and would have all the signal inputs and outputs you need for sound card digital modes.

VOX may work fine for PTT, but if you want or need to use a Com port for PTT, you will need a transistor driver to convert between RS-232 levels and your radio's PTT level.

Key word there dude is "basically"! I found the "hardware" for $55. His point is very realistic.

I run UIView APRS, WinPack BBS (and everything else) on a $55 (TOTAL) Pentium multimedia box. I did add a V90 modem for FREE 50KB (actual) net access. So I have everything I need to send HTTP over the air with AGWPE (new version 2000.78 is out). It doesn't even need Linux. Linux is an interesting option though.

http://www.raag.org/sv2agw/

If you don't have any ideas then you better move out of the way. :)

I guess I didn't make my concern clear. How do you plan
to maintain a reliable connection? You will be receiving
microwatts, and the neighbors' kids will be keying up on
top of you from 200 feet away. Remember, you won't "own"
any channels anymore than you could on CB. This is an
issue of practicality, not legality.

For 1.9 GHz, you should probably use "polyiron" instead of ferrite.
Available from suppliers
such as Emerson and Cummings.

>
> Have you heard of Metricom Ricochet?
>
OK so I answered you Q and you just ask this? Well yes I have. I do not
know everything there is to know about them.

I do know you missed the glaring point. My idea has no middle man. It
works like APRS works. How is that paid for. I think we could have a
low cost radio computer combo.

Have *you* heard about the modified wirless LAN cards? That's if you
want hi speed (we do). If everyone with a computer had on then we could
all be on a shared network. Something like the advanced Linux
experiments where you have NO server. Everyone is part of the server.
If one goes out then it would just use another. Likewise our computer
radio would always be available for LOCAL transfer. Didn't your mother
teach you to share.

It could start with small local networks (ie your neiborhood). It could be linked through the internet as a backbone at first or permanantly.

Now will your take these idea's to your supervisior and make them a toll (paid) monthly per minute charge? I don't care because I will create with freedom.

There's a big difference in saying that we'll have to work around a given obsticle and simply harping we can't. This during our whole process of hard work, synergy and God given creativity.

> > Get people on board with real communication benefits. Make it full-
> > duplex.
>

>

First you brag on comercial full-duplex and then you ask this. Don't you know. It depends.

> > Use $20 FRS rigs.
>
> Why? How does this actually help? The FRS radio alone is just
> a narrow-band FM radio with no data capabilities. What do you use
> for a modem?
>
Well, because it's $20 darn bucks. It's alot for $20 if we use it in a network (or repeater, or digipeater, or internet linked, or whatever).

Now let me ask what *you*. Haven't you heard of AGWPE? Don't you know we don't need a TNC anymore. Also, like I'm saying; we could write any wirless protocol for a soundcard. It's a DSP. Soundcards are $20 NEW!

> > Make it as fast as commercial robber-barrons at no charge. Hey mabey

Translation: His idea is basically already done. All the parts are easy
to visualize and are sucessful elsewhere.

My idea is harder, takes more time and effort than you're willing to
help with. Naysaying isn't and idea.

> Why do ask about my paycheck? Are you intent on impeaching my
motives?

I'm not being nosey. I just can't understand your motive. Are you
trying to appear inteligent?

> Here's a clue: mobile wireless data is already a large market. I'm

>

Everyone has an opinion.

So anything new or that needs ironing out is half-baked? Well I guess
anything "baked" was half-baked before hand. Do you take your cookies
out of the oven when they're half-baked and throw them out too?

Do you see when an idea is "baked", then your basicaly done creating
it. It's not an idea then. Don't rag on peoples ideas. It's imature.

> > How is Linux created for free?
>
> Ah, the Open Source concept. It's not a business, it's a religion.

>

So it's half-baked too? First, your kind says there's no big companies involved. Then you suggest those companies now on the bandwagon are a cash cow. Wrong.

I don't think you WILL get it. Open source works. It's a different persective. You're suppose to be good at that. Remember? Why don't you get it?

> Here's how I'm helping out - I'm offering you a series of objective
> sanity checks completely for free: MURS is not the ARS, MURS will
> not support a wide-band deployment.

Thanks for the free opinion but offering "sanity"? Translation: naysaying. If you were truly objective then say why. Then we'll solve the problem. There is a way around every road block.

Listen people. An invention means something that we previously couldn't do! That is where wisdom enters in and what I'm saying about knowlege and what we think we know.

> Even Stewart promotes MURS
> as an alternative to ARS only to avoid content restriction and tap
> into lower-cost consumer equipment.
>

Don't put words in the mans mouth. Why do you promote wasting money? I don't think he promotes MURS over ARS persay. Neither do I. Simply stating their pros and cons only shows they are not equal.

I love ARS and it's pros. I think we need more of them. I may use MURS advatages and have no childish notion of disertion for doing it. Why do

you. Don't you know they have near the same scientific characteristics? Many of the lowest cost and best radios do both "bands". That "band". Why start a holy war over it.

I said....
> > The begining of knowlege is knowing you don't know everything. Next is

> an anonymous identity.
>

Oh please! I thought you were just missguided. have you ever heard of privacy. Let me be frank. Those with that opinion are haughty and foolish. As to my credibility, it's not up for a vote. Is yours? You don't really mean it do you?

Now, I do think we need to be responsible with anonymity. I am.

I'll only say this...

Ben Franklin (great inventor) said some thing like....

If you give up part of your privacy for security you may find you have neither. One could factually RESET your computer. Don't you know about security updates?

> > Merry Christmas.

No, on either count. I'm not a nay-sayer, nor am I worse.

> > Have you heard of Metricom Ricochet?

> OK so I answered you Q and you just ask this? Well yes I have. I do not

> know everything there is to know about them.

The key is that Metricom has figured out a scheme for deploying
such a network over a very broad area. They're already doing it,
and, yes, it costs money.

> I do know you missed the glaring point. My idea has no middle man. It
> works like APRS works. How is that paid for. I think we could have a
> low cost radio computer combo.

How APRS works? A moderate handful of high-level digipeaters and
a lot of nodes that transmit a lot.

Could you elaborate on the "low cost radio computer combo" ?
I assume this means a radio connected to a computer, not a device
which integrates a computer and a radio into one consumer-ready
unit?

> Have *you* heard about the modified wirless LAN cards? That's if you
> want hi speed (we do). If everyone with a computer had on then we could

Sure, I've heard of these things. Peer-to-Peer (aka P2P) is a big
buzz these days, but most of the concepts have been around a long
time, and most of the "P2P" plays ultimately have a server somewhere
to aggregate the "peers".

Certainly, IP networks have long enbraced the notion of robustness.

Why should anyone share their network connections (particularly when the network connections are provided pursuant to terms-of-service/acceptable-use-policy which prohibit such sharing?) ?

I remember the hey-day of packet radio quite well, it wasn't that long ago. A lot of hams put systems together and put them on the air, and shared them - as long as it was fun and interesting. Then, one by one, they started losing interest and turning the equipment off. In the area I was living, we had a BBS operator that worked diligently to avoid any competition, put a lot of radios on the air and worked through the BBS organizations to make sure he had the only game in town.

One day, he lost interest and turned everything off, and that turned off a lot more than his own activities.

That's what happens when you depend on volunteers. When it stops being fun, they stop playing.

I'm not nay-saying, I'm pointing out a reality.

> It could start with small local networks (ie your neiborhood). It could
> be linked through the internet as a backbone at first or permanantly.

I suppose I was providing that service at 2Mbit/s before anyone cared ;-).

> Now will your take these idea's to your supervisior and make them a
> toll (paid) monthly per minute charge? I don't care because I will
> create with freedom.

My supervisor! There you go talking about my job, as if it somehow motivates me to denigrate the notion of "free wireless networking".

I won't take your ideas anywhere, because they're already in deployment, certainly in the Metricom architecture. Have a look at:

http://www.metricom.com/ricochet_advantage/tech_overview/index.html

I *love* the idea of wireless networking. It's a fabulous thing, indeed. It's been over five years since I built WaveLAN drivers for my Unix boxes and, only recently after moving, have I not had a 2Mbit/s network operating 24/7.

Nope, I'm not trying to prevent some kind of competition, not at all.

> There's a big difference in saying that we'll have to work around a
> given obsticle and simply harping we can't. This during our whole
> process of hard work, synergy and God given creativity.

What's the obstacle you perceive? Scalability? Reliability? What is your goal, free wireless network access?

I do not recall "bragging" on anything, much less "commercial full-duplex".
I'm asking what "full-duplex" has to do with the network. Do you mean
full-duplex data radios? Do you mean full-duplex IP telephony? I don't
know what you mean.

Of course I've heard of the sound-card data implementations. They're
pretty neat at 1200 baud, and not the hardest way to do 9600 baud.

Of course, those $20 MURS radios won't support 9600 baud in the limited
channel spacing and transmit/receive turn-around common in inexpensive
PLL designs.

Are we talking about a 1200 baud RF network built with off-the-shelf
radios and using sound-cards? Hams have already tried this and it didn't
exactly catch on. I'm not nay-saying, I'm observing recent history.

Of course I know that. However, you're not going to get anything even remotely
close to "full-duplex" 4800 baud with $20 radios and sound-card modems, that's
been my point all along. I don't know how you plan to work hard and cleverly
work around the physical limitations.

This sounds like packet radio all over again. Perhaps you could do it better?

>
> Great then. Let's do something new.

Right then, would you like to discuss something new? So far, I haven't heard anything new. $20 HTs attached to some kind of modem (TNC or sound-card, doesn't matter), networked via landline systems. I don't mean to nay-say, but this not anything new.

> > Stewart's idea for MURS-based

What exactly is your idea?

Deploy low-power wireless network adapters, perhaps attached to landline networking? Metricom is a commercial venture doing this. Hobbyists have done this as well.

Those $20 HTs don't permit a high-speed network. What's the alternative?

> > Why do ask about my paycheck? Are you intent on impeaching my
> motives?
>
> I'm not being nosey. I just can't understand your motive. Are you

> trying to appear inteligent?

My motive was something like "help a fellow enthusiast avoid banging
their head against a problem that's rapidly being overcome by consumer
devices". It is really an altruistic motive, perhaps I'm being misunderstood.

> > Here's a clue: mobile wireless data is already a large market. I'm

Ah. Now who is the nay-sayer? I believe this is where we fundamentally
part logical ways. I'm not worried about appearing intelligent, and I thought
I had something to offer in helping you appear intelligent. In your broad
dismissal of the existing commercial wireless deployments, we're no longer
on the same page.

I recently drove from near Napa Valley to Los Angeles. At no point was
I ever outside 9600 baud full-duplex data coverage. Not once. Sure,
it costs money, but *it works*.

> > For starters, have a look at http://www.AnywhereYouGo.com/

Observing that something is half-baked is part of understanding that
it needs more cooking. I believe you're annoyed that I'm not helping
you cook your idea. Well, I *really* am, when I offer links to resources
on current wireless networking technologies, I'm trying to help.

When I think about what you're proposing and carry it through to the
ultimate conclusion, I end up with something that looks a lot like
Ricochet implemented by hobbyists and volunteers, and I don't
believe this is (a) new or (b) practical.

Not only is cloning Ricochet not new, the volunteer aspect makes it
completely unreliable. Once it stops being fun, people will turn their
nodes off.

> Do you see when an idea is "baked", then your basicaly done creating
> it. It's not an idea then. Don't rag on peoples ideas. It's imature.

I think I have some decent wisdom to offer here. Are you really suggesting
that I'm immature?

Open source, Linux in particular, became the rallying-point for those
businesses intent on unseating Microsoft's dominance. Investors
viewed it as the "Next Microsoft" - i.e., the Next Big Thing, the next
huge cash cow.

Investors have run out of patience with Linux for the most part.

At least one commercial Unix vendor is already making their
supported products available under a version of an open source
license; see http://www.sun.com/dot-com/software/free.html

Why is Sun doing this?

What I "get" about open source efforts is that they work well
as a tool to gain mind-share and ultimately sell hardware. There's
a persistant hope that open source efforts will eventually lead to
the sale of services, as well.

Fundamentally, my issue is that volunteers are not reliable enough.
Help me understand how to solve that problem. It's not a technical
issue, though.

> Listen people. An invention means something that we previously couldn't

I'm not putting words into Stewart's mouth. Go back and read his note that
started this thread. Stewart stated his view of the pros and cons and declared
MURS superior.

> I love ARS and it's pros. I think we need more of them. I may use MURS
> advatages and have no childish notion of disertion for doing it. Why do
> you. Don't you know they have near the same scientific characteristics?

I'm not starting a holy war of any kind, though I sometimes suspect Stewart
is intent on doing so. Would you please explain what "best radios" means
in this context?

> I said....
> > > The begining of knowlege is knowing you don't know everything. Next

> Apparently not.

Hey, perhaps I was a little forward in this statement. Please forgive me
for any undertone of personal attack. I simply don't think you're giving
enough attention to how the commercial wireless community is solving
the same problem you seem to be working on solving.

> > I'm fairly aware of what I don't know, and I'm quite aware of the
> > dangers of limited perspective, exactly what I was trying to help
> > *you* with.
> >
>
> Explain to me what you don't know. :)

What I don't know vastly outweighs what I do know. Sometimes
I wish I was 19 again, because that was a time when I thought it
the other way.

> > Something else: if you want to gain even a modicum of credibility,

I sign my real name to my posts. You don't sign your posts.
My reputation is associated with my words, your reputation
is safely hidden from your words.

> Now, I do think we need to be responsible with anonymity. I am.

Sure, you're a nice guy. Too bad you're anonymous.

> I'll only say this...

Of course I know about security updates, and I know exactly what
my posting headers advertise. Frankly, I think you're overstating the
risk. Anyway, we're both advertising the same things about our
computers - we're both dial-up customers, one with PacBell and
the other with Mindspring. Maybe I'm just more comfortable with
my IP security measures here.

I couldn't think of a more succinct description of exactly the issue
that I've seen, as well.

Hello David,

Please do NOT use the connector you mentioned, this is not correct.

Setup however is very easy indeed.

On the back panel you will find the phone jacks "AF OUT" and "PATCH IN" between the "KEY" connector and the "13.8 V DC" connector.

These are the ones to use.
Simply run one shielded cable from from computer soundcard "output" to "PATCH IN" on the FT990 and another one from soundcard "line in" or "MIC" to "AF OUT" on your FT990.
No additional hardware or attenuators are needed.

Please open the volume control on your computer (usually the loudspeaker symbol on the bottom right taskbar).
Make sure that in the playback screen everything is "Muted" except "Wave" and "Volume Control"
On the recording screen, which is accessible through "options" an "properties" make sure you only select the input used. (either "line in" or "microphone" depending upon the input connector you used on the soundcard)
Put the appropriate sliders about halfway to start with.

Start your PSK software, I prefer WinWarbler or Digipan and make sure on transmit that you adjust your "MIC" control on ur FT990 such that your ALC meter does not show any activity while at the same time giving maximum output power which should be not more then 50 watts (setting by the RF PWR control on ur FT990)
This requires some switching back and forth of the meter swicth to check both output and ALC but is very important as otherwise you are overmodulating and splattering all over the band.
ALC activity should be checked regularly especilaly when changing bands or antennas.
If the "waterfall" display does not show enough activity then increase the setting of the playback volume slider in the computer volume screen as per above.

This setup works perfect and has been used by me since the beginning and I already made well over 700 contacts.

Good luck and please look for me on the bands, see below.

>

Well you kinda are. First you say you want something that's realistic
then you say it's nothing new. Well the lightbulb wasn't realistic
until it was invented either. Still it wasn't the "light bulb" as we
know it until it was accepted for it's COST EFFECTIVE BENIFTS.

>
> What exactly is your idea?
>

That we might be free. Real cost effective comunication benefits. Free
stuff. Yea, that's right 100% free. Linux is free. That doesn't mean
it's worthless. Of course there are hardware costs typically but it's
possible for them to be less than a good dinner out! That's why I
reference the AGWPE.

http://www.raag.org/sv2agw/

> that I'm immature?
>

Is it wise or immature to point out problems incontructively? Is it
wise to suggest things are going to be the way they are just because
that's the way they've been?

> What I "get" about open source efforts is that they work well
> as a tool to gain mind-share and ultimately sell hardware. There's
> a persistant hope that open source efforts will eventually lead to

> the sale of services, as well.
>

Well that's one way of looking at it. What Linux needs most is cost effective benefits over Winblows. It needs to have the BENEFITS of Windows and then more of what Linux does best. But that's a whole 'nother story.

> > Thanks for the free opinion but offering "sanity"? Translation:

> > the problem. There is a way around every road block.
>
> Fundamentally, my issue is that volunteers are not reliable enough.
> Help me understand how to solve that problem. It's not a technical
> issue, though.
>

No, it's not just a tech issue I agree. Fundamentally, my point again is innovators will rally around real world cost effevtive benefits. Linux is the model of WHY it works. That is fact.

> > Listen people. An invention means something that we previously
> > couldn't
> > do! That is where wisdom enters in and what I'm saying about
> > knowlege
> > and what we think we know.
>
> What are you trying to say here?
>

That anyone can balk and say it can't be done just because it hasn't yet been invented.

That we learn a scientific principle and wrongly think revision of that perspective can not be accomplished.

That we fail to realize innovation also includes working around roadblocks.

Too many indians and not enough Cheifs.

That true wisdom is more than persective. It's more than vision. It's a *new* vision. It's creativity. It is innovation. It is future, not past. It is forward not back and not park.

Sure look at the road block. Don't worship it. Think positively. Don't condem effort. Dare I say, have a little faith.

RF is a God given physical thing. Great innovators have devised a way to span great distances at the speed of light using RF. That doesn't mean we fully understand electromotive force. It's a Godly force greater than atomic force (physicists confirm). It's a great mystery. Don't think innovation with RF is over by any means.

The real benefit is we can comunicate mind to mind over great distance
any time.

> Stewart stated his view of the pros and cons and declared
> MURS superior.
>

That's an inaccurte interpretion. A spin. Ask him.

Also I think he was just saying one way is to start simply. He asks a
wise question about text base ideas. Can we get a benefit at lower
speeds? Is it cost effective. (look at APRS)

> > I love ARS and it's pros. I think we need more of them. I may use

> Stewart
> is intent on doing so. Would you please explain what "best radios"
> means
> in this context?
>

The newest.
The most cost effective.
The most modern features (the ones with benefits like speed dials).
The best distance (cost) vs. penatration (in buildings) balance.
Very versitle. Air/2m/MURS/Police/Fire/Weather or much more.
Cheaper feed line (if needed).
Cheaper antennas.
More that many already have.
Dual use (2m Voice/simplex/Repeater/autopatch/Packet/MURS/New stuff and
more).

> > I said....

>

Please forgive anything I wrote which you may take as condeming too. We can disagree. That's good. That promotes solutions. We shouldn't condem, that's evil.

I/we all need to look closely at innovations in the commercial wireless arena. Agreed! They have learned much from Hams. We can learn where not to reinvent the wheel. Agreed.

No. It's wise on the internet and my words still speak for me and my character. In what I say and in what I don't say. I have no fear of man. It is God what makes me quiver. Thankfully for me, he is forgiving. That is true love.

I agree with everything Rick says. RckRtty is a fabulous product, and the product of choice if you run Windows ME with a PTC-II. However, the moment PKterm is compatible with the foregoing, I intend to give it a try. RJB.

Could anybody provide me with a reference for how cell sites interconnect and handle soft handoffs? One book that somebody recommended was CDMA for Wireless Personal Communications by Ramjee Prassad.

Should I buy the IS95 standard?

Thanks,
Chuck

5092. APRS/MySQL/AGW Interface

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-12-26 18:07:37 UTC
From: Steve Sampson <k5okc@home.com>
Message-ID: <J7526.77773$x6.36135203@news2.rdc2.tx.home.com>
Source record: 9780

This code is kind of ugly yet, but it may help others working
on the same thing. Basically it connects to a distant (or local)
AGWPE via TCP/IP and puts everything it hears over the radio
port into the MySQL database. A pass-2 daemon (not created yet)
will then extract data from the frame table to build a filtered
table. A pass-3 daemon (not created yet) will then actually
decode the data. Critique welcome (I'm not sure all the IP
fragment stuff is necessary, or done right).

It does load the table...

>without interfering with the other allowed modes (weak signal & repeaters).

False. We have been operating a duplex 56 kb digital repeater system here for
several years. It is 222.4 MHz in and 223.85 MHz out, located on Sweat Mountain
north of Atlanta. Fully coordinated by SERA. Most of our user access switches are
on 70 cm, but this 1.25 m hub has served its territory very well, and was chosen
to avoid a serious 70 cm interference situation that exists on the mountain.

>No
>one has been permitted into the 219 segment due to intereference issues with
>the primary licensee of that segment. If it is in fact being used, it's
>certainly not coordinated (and for the 219 MHz segment, coordination is
>required for the transmission to be legal).

False. We have been using 56 kb coordinated channels in the 219 MHz band for
point to point network links since shortly after the band became available. The ARRL
handles coordination of this band between amateurs and the inland waterways radio
service. The band is divided into 10 100 kHz channels (which acomodates our 70 kHz
wide 56 kb MSK signals, and provides a guard band).

We've yet to encounter a location where at least some of those channels can't be
coordinated for amateur use (typically we can use all but 1 at a particular location).
There is so little use of this frequency range that we've found that very simple bandpass
filtering is usually sufficient to avoid the IMD problems we often have to fight on our
70 cm high sites. That makes it an excellent choice for network links in and out of
the RF congested high sites we use for our user access points to the network.

The local packet guys around here, apparently, tried to get 219Mhz channels allocated, but apparently, in the SF Bay area there's a commercial service, that uses one frequency in the band, that has the authority to block amateur access to the entire band. I think it's some kind of marine telephone business -- or something like this. I recall, someone made a petition for a rules change, that if we could demonstrate that we wouldn't interfere with them, we should still be allowed on the band, but I'm not sure if any progress was made on this.

My thinking is that hams should try to get on these channels, if at all possible, to establish amateur use of them.

I believe you're over-applying the Linux analogy here. Linux source code
may be freely shared, but that's just software and not a service. A wireless
network as you propose is a *service*. People will need to actively contribute
time and money to keep it going.

I can write a bunch of code, get it working enough to satify myself, and
then give it away, without ever spending another minute or dollar on it.

Practically speaking, I can't ever "turn off" the code that I wrote. In engineering terms, I can contribute my NRE without promising anything else.

Suppose I volunteer to provide a wireless network node. I have to pay for equipment, electricity and Internet access, as well as maintain the node. The day that I'm not interested in it, I can turn it off.

Free source code does not equal a free service.

Steve Sampson has a practical observation about this himself.

>Do you have any pointers to anyone who actually has
>something on air and working?
>but has nothing up and running yet. Just talk.

They supposedly have done test links. There are a few links operating
in some australian cities, IIRC. And supposedly there is an english net
that has a few links going.

And of course there are the commercial ISPs. One in Iowa was written up
pretty broadly a year or so ago (ruralnet?). One near me is doing
pretty good for a few people, but they are having a hard time getting
enough coverage to sign up enough people to make money. (bigskytel.com)

That I think will always be a problem for a commercial venture. It think
the co-op style has more potential. But they are not without their own
problems... Siting for the base links, and cost/convenience per node.
Right now the tradeoff for a low cost node is low convenience, which
limits the locations available. I've been doing some preparatory
experiments, and it looks good to set up a wireless link between my
brother and myself (several miles).

And once a few links are fully operational, then more people are willing
to spend the money and soon you have a net. The wired internet took 10
to 20 years, but the wireless city nets will be less (I'm guessing about
5 years). I don't know if they'll be low bandwidth cellular based
commercial, or high bandwidth co-op style. But people want it.

You present a dichotomy between "low bandwidth cellular" and "high
bandwidth co-op" as if these are the only options on the landscape.

I believe the dominant wireless players will be high-bandwidth
cellular operators. Integration of telephony and voice, taking advantage
of the economy of scale and providing highly-available service.
Think "3G".

Wired broadband will dominate the home market.

Good summary. I had heard of all that. Light pole node and all but it
is not in my area. It cost big bucks. I'd rather have my own hardware
than pay mouthly or nasty per minute fees. I don't wish to live that
way. I do want low cost hardware. That's what we're talking about.

My point here is simple. You would have said free software isn't realistic either. But that's not true. I can put that free software on low (to no) cost hardware and acheive real world benefits that cost effectively beat anything else. Now it may be technical. I don't mind that if required. Most Hams (or other innovators) don't either.

Of course the goal is KISS. The more technical persons help the less technical. Yes, just as with Linux. Note again by the way. Linux needs to be made more KISS.

Wouldn't it be great if the ARS took the lead in innovation back here?
Let the sleeping giant awake. We sure need to. We have the talent
perhaps we need the vision. See below...

>
> Wired broadband will dominate the home market.
>

I sure hope so. I too beieve (with somebodies innovation) wireless
higher speed will prevail. I'm just worried no one will be able to
afford it. Just look at the cable modem monopoly. Let's work on it
together.

My idea is like Metrocoms but also like the internet in that no one
owns it. Except your own RF station / computer.

What wrong with that? Especially with the Internet as a potential
backbone.

It just won't work in the "West."

Western countries are pure capitalists. There is some guilty socialism
(probably should be "socialized" as the former term has a lot of weight
to it anymore).

It is not accurate to say that no one owns the Internet. It has always
been owned by someone. First government (military folks that needed
to kill the enemy) and more recently, commercial entities.

Most people have "Internet" connections already. They have cable,
dsl, and 56k modems, and this is adequate for them. Most people
don't need pagers and cell-phones. They are pure expendable
income "status" symbols. I almost feel sorry for them, as they
are completely lonely without them. I once had a lady make 10
calls at the airport. She was sitting right next to me. On the 11th
call I told her to put the phone away, or I was going to shove it
up her ass. She had the remaining intelligence to move away.

Before you spend any money, ask all your friends if they would
be interested in investing (long term) in a telecommunications
company. Tell them you don't know how much it is going to
cost in the end, but that it will be "real fun."

Report back on their investments...

Steve

That sounds much more complicated than necessary, unless I am unaware of some other factors which required Nielsen to achieve distribution to such a small focused group of viewers.

Local TV station network affiliates rather routinely "roll-in" (or "cut-in") alternate content in place of individual commercials which are included within network programming delivered to a particular market area. As you suggest, this could be a different commercial for the same product or else for a different product when the advertiser wishes to do so. Or sometimes they will roll in an unrelated commercial, or even a PSA (Public Service Announcement) or SPA (Station Program Announcement) if they cannot sell the spot although this is rather unlikely during primetime network shows.

Perhaps this is also done nowadays to some extent with CATV local insertion although most of those systems do not seem to be that sophisticated. An exception may be centralized operations in big markets like NYC, I'm not sure.

I'd be curious in any event to learn more about this MarketMakers system.

Frequently, surplus equipment from failed or discontinued commercial ventures ends up being used for another purpose. For example, the DowAlert (sp?) SCA-FM receivers which were donated and retuned to receive subcarrier radio reading transmissions for the visually impaired.

However, I imagine that too much stuff just goes to the scrap heap :-(
Kind of sad.

That same station also has blocked Southern California, Oregon, and Washington from access. I believe that Nevada, Utah, and Idaho have also been blocked by that user (due to elevation issues of the western slope of the Rocky Mountains), but I'm not certain.

Many of the "great lakes" states have been blocked by users related to those waterways, and supposedly the same with Mississippi River waterways (and tributaries).

If this has been allowed in Georgia, it's the exception; not the rule.

That's a very good point. Watching time verses money is wise. I'm talking about something people want. At least something technical persons want. At a more lower cost. Like some Hams and some computer users.

For example in basic slow packet ; I can set someone up in no time at all with their 2m, Computer (W98) and Soundcard running AGWPE for a TNCless node using almost zero ADDITIONAL dollars. Maybe $2 at rad shack for 3 components. Check your junk box. Others can just by a interface like Bucks' for $20 if you can't solder.

Your blanket prediction of demise; I disagree with. If you apply the same logic. There would be no ARS.

If you give up innovation and leave it all up to commercial services you will be over charged. Do you see my point? You are at their mercy. By the way there stuff "ain't" perfect either.

LOL! The digital age has brought many challanges with it. Don't get
postal on us now. People should indeed be considerate about the use of
comm devices. Had she been talking to a person next to her though, it

wouldn't have been much different.

Vibrate mode is the real answer to personal communication curtesy.

I am NOT talking about just "fun" or just "hobby" benefits. I do not think ARS is JUST a hobby. It can be fun and a hobby but we need real world cost effective benefits. Like using the autopatch to see if my wife needs milk and eggs. Why pay cellular services for that?

Can't we come up with some new stuff?

We need real world cost effective benefits!

That would be nice. But I haven't seen it or prototypes of it.

>Wired broadband will dominate the home market.

Population wise, almost definitely. Kind of like (do I dare bring it
up?) the U.S. presidential election, where even though gore got about
50% of the people, he won only 10% of the land area. The 50% of people
that don't live in big, high density cities want broadband also, but the
economy of scale just isn't there to run fat-pipe wires around.

And the same holds true of the world... Many developing nations do not
have wires. They skipped wired phone and started with wireless. That
wire infrastructure costs too much per mile if you can't sign up
everybody. So they go wireless.

If the cable companies and telco's don't get off their butts and take
advantage of their wires, people are going to go with wireless internet
(either groundbased or satellite). Once they experience always on
broadband connections, they want it.

Yeah, this is the $64,000 question. Everyone seems to be converging
on a vision of cell phones where people walk around little boxes they
can browse the web from, and watch little movies and do all sorts of
high bandwidth stuff. You know, Dick Tracy watch and like Austin Power's
little TV that he has in his dashboard -- the whole
bit. But, like, uhh, excuse me, seems like there are some nasty
technical issues here. And, I agree there are some super smart
people working on the problem, but sometimes I wonder if we'll end up
with another HDTV -- where it seems the emperor really doesn't have
any clothes. Really.

I guess if the high bandwidth cell phone doesn't really work, it'll
be another HDTV disaster -- only times 100. Cell phone might
have the advantage that the companies have some incentive to make
it works -- whereas the TV networks would just as well have HDTV
die a quick death.

Of course, digital ham radio seems to suffer from some of the
same expectations. We hear it here all the time from the
'Why doesn't packet run at 10mbps' crowd.

Yes, and on S-band. When the U and V transmitters turn out to be both lost
(this is still far from certain!) we might see a quick migration to S-band.

> Wired broadband will dominate the home market.

optimistic but IMHO wrong.

Given the prices of telecom infrastructure, and market demands for
short-term profitability, there will be at most two high-speed
access providers in a given market.

Most consumers are willing to spend only $30 to $40 per month on
high-speed Internet services. This price sensitivity was created by
experiences with dial-up and marketing from cable modem providers.

At that price point, most broadband services are running at a loss and
aren't even covering capital equipment costs let alone personal salary
and bandwidth.

The numbers I've seen for fiber plants state that it costs roughly
$1000 per home passed. If there are approximately 4000 homes such as
there are in my locality, the fiber plant alone will cost at least $4
million. Assuming a 30 percent penetration (1200 homes), you will get
approximately $48,000 per month revenue ($40 per month).

A T3 pipe is probably the minimum one could use for this size
population and would run approximately $30,000 per month.

people costs would probably run about $50,000 per month (technical
support, engineering, network and server administration)

So, from the get go, you are at least $4 million in the hole (closer
to 5 million if the cable modems are subsidized), you have a monthly
run rate of $80,000 per month.

If you only have a 30 percent penetration, you are losing $32,000 per
month. If you have a 60 percent penetration (2400 homes), you are
making $96,000 which gives you $16,000 per month to pay off your
capital plant. This means you can pay off the plant in 250 months or
21 years.

What does this have to do with wireless? If you follow the same
model, you will see that as soon as a second competitor arrives,

neither player can pay off their capital investment. You need a monopoly ownership of the market in order to recover capital expenses.

While a wireless plant is cheaper than a fiber plant (roughly $500,000 to $1 million per cell), it reaches a smaller number of subscribers, has almost as expensive bandwidth requirements, plus has a much higher initial outlay in terms of the license costs from the auction.

given the economics as I have outlined them above, in urban spaces you'll see maybe two competitors for high-speed data services. In suburban and rural spaces, there will be at most one player. It's highly likely that a single player will in a market will discourage any other potential competitors from entering that marketplace.

personally, I would love to see more competition in the telecom space but unfortunately it isn't going to happen. We've split our infrastructure the wrong way and not recognized the natural monopoly aspect of last mile and regulated it as such.

Another site for uptodate info (usually), directly linked to the
command stations via mail from DB2OS to DL6DBN:

http://www.amsat-dl.org/journal/adlj-p3d.htm

(the UK site is cutting/pasting those, and items posted by DB2OS on
amsat-bb)

Rob

Latest news:
Dear All,

We are pleased to report that the AO-40 Flight Software is now completely
re-loaded, excepting the D-block and WOD routines which can be done
later.

James G3RUH found that commanding on L-band was very easy. Even at a
very bad pointing angle of ~50 deg he could uploaded a non-FEC block on
4 watts at the TX (~250w e.i.r.p.). Thus the L-Band uplink seems
to work nominally and excellent..

73s Peter DB2OS for the Command Team

Hi,
my question sounds maybe curious. I've found just one web page link related
to this theme and it's out of order a long time:
http://www.tu-bs.de/studenten/akafunk/pr8051/index.html
Frankly, I'm looking for open source code ['near to #include' in .asm or .c] of
(AX.25) HDLC protocol implemented in 8051/AVR/Microchip PIC microcontroller for
simple networked slow data/telemetry modem purpose. Or should I start to
reinvent another media access and network layer?

Any hints or pointers will be highly appreciated.
Thank you.
Tom Iansta

Neither do you.

However they have people already interested, they have tested links,
and they have high bandwidth and they have dreams. Your dreams are
nothing but memories of 20 year old packet radio, without a license.

Timewave's special Y2K price for PC PakRatt Ver 2.1 for Windows 3.1 will end on Jan. 2, 2001! The old price of $29.95 for the upgrade has been in effect for the entire year 2000 and will change on Jan 3, 2001 to $59.95. This means you must order now if you want the $29.95 price.

The price for the full version of PC PakRatt ver. 2.1 for Windows 3.1 will change to $99.95 on Jan 3, 2001.

Contact Timewave via:
Telephone 651-222-4858
FAX 651-222-4861
e-mail sales@timewave.com
website http://www.timewave.com

If you are using Windows 95, 98, ME, or 2000, we recommend you use PK-Term'99 available from http://www.cssincorp.com (256-381-6100).

Let's be careful not to confuse "wireless" with "wired". I tend to
suspect that the two will not compete in the same space.

> Given the prices of telecom infrastructure, and market demands for
> short-term profitability, there will be at most two high-speed
> access providers in a given market.

This is fair, but does not imply that wired and wireless operators
will be competing head-to-head in the same "high-speed access"
space.

> Most consumers are willing to spend only $30 to $40 per month on
> high-speed Internet services. This price sensitivity was created by
> experiences with dial-up and marketing from cable modem providers.

An increasing number of consumers are apparently being convinced that
Internet access is like the ether through which radio signals propagate,
thanks to subsidized efforts such as bluelight.com (which ended up buying
the ISP part of spinway.com when spinway ran out of money and went
belly-up).

There is no such thing as free Internet and anyone that thinks otherwise
is ignorant, naive or fantasizing. A harsh fact but reality nonetheless.

A subsidized service that costs users nothing is not free.

[Good, but contentious business analysis of ISP access business
deleted]

I won't quibble with your numbers and assumptions here, other than
to say I think you're making some extreme assumptions to end up at
the conclusion you do.

The simple point, wired Internet backbone is not cheap, especially
when you scale up in terms of traffic and availability.

> given the economics as I have outlined them above, in urban spaces
> you'll see maybe two competitors for high-speed data services. In
> suburban and rural spaces, there will be at most one player. It's
> highly likely that a single player will in a market will discourage
> any other potential competitors from entering that marketplace.

I don't believe the wireless and wired ISP space unify as you apparently do. In the United States, the penetraton of wired Internet is relatively high, let's just estimate it over 60%, and the wireless telephone penetration has historically been much less, let's just estimate it below 30%. In Europe, this is inverted; in some European countries, wireless penetration is easily over 70% and wired ISP is well under 30%. To be fair, wireless penetration is showing signs of exploding in the United States and may rapidly grow past the 50% mark, but it's already pretty clear that wireless data services will not directly compete with wired services.

It is not likely that people desiring broadband service will turn to wireless, and people interested in mobility are not likely to require the same level of broadband performance, at least in the US. When you cut away the hype, wireless is about *services* and wired is about *broadband*. The two don't directly compete.

Of course, I could be wrong. I'm certainly not attempting to invalidate the core of your argument that there isn't room for a lot of competition in the "last mile" of access, I'm just not as willing to believe that wired and wireless are truly equal there.

I'm not sure who "everyone" is here, Cathryn. There's certainly a push towards high-bandwidth capability but the network cost models that I've heard don't support the notion of a lot of high-bandwidth traffic. Instead, the focus seems to be on reducing latency and improving user response of wireless services.

Wireless video to handsets - perhaps for news clips, but think about the experience of watching a movie on a handset; it isn't appealing. People have relatively short interactions with handsets.

> the ISP part of spinway.com when spinway ran out of money and went
> belly-up).

very good point. this is the reason why one of my clients (ZipLink)
went belly up a month or so ago. They had a very nice network and
dial-up access infrastructure. They were selling access to people
like spinway but when two of the subsidized ISPs went poof in one
month, they lost a big chunk of their revenue which caused them to go
poof as well.

>
> There is no such thing as free Internet and anyone that thinks otherwise
> is ignorant, naive or fantasizing. A harsh fact but reality nonetheless.
>
> A subsidized service that costs users nothing is not free.

the free Internet service business is a poorly transported idea from
the UK. The reason they got started there was because of arrangement
between some ISPs and British Telecom. In the UK (as well as other
parts of Europe) all calls are billed by the minute. Some ISPs were
able to convince British Telecom to split the per minute charges when
users called their modems. Therefore, the "free" ISPs were actually

paid out of your phone bill.

In United States, free ISPs couldn't work this way unless they were a CLEC. Most of them counted on transfer pricing models based on advertising and some even required the user to click through on advertisements every 15 or 20 minutes in order to maintain the connection.

The free ISPs that were CLECs survived because of a quirk of the telecom act of 96. At that time the Baby Bells were only thinking of competition in the local loop arena. They slipped in call termination charges figuring that any CLEC offering local service would have to pay them for calls terminating on the Baby Bell networks. They saw it as a gold mine or a way of keeping CLECs in their place because they figured more calls would terminate on the bell network than on the CLECs network.

In comes the Internet and dial-up access. All of a sudden you have CLECs forming that only accept calls in the form of modem connections. The Baby Bells are now paying millions to these CLECs for all the CLEC terminated calls. The Baby Bells start crying foul and try to change the rules that they created. This was the source of the flap about Internet related calls being classified as long distance (i.e. no call termination charges) vs. local calls (i.e. call termination charges)

>

remember, most European wireless Internet access is WAP or WAP like. People don't browse the Web on their cellphones. They send messages, they pay for soft drinks, and they even call each other.

>

> are truly equal there.

I like this perspective but if you do the analysis on the perspective you find that the business case gets even worse for wireless. It gets worse because you need to look at who is going to use the network and for what. WAP is a nonstarter for a variety of reasons but mostly because of usability and speed. I've seen some reports which describe taking two to three minutes to get a weather report.

If it is users with PDAs and laptops, then you need to find enough people willing to spend a monthly fee ($10? $100?) for an intermittently used service in addition to what ever services they are currently using.

Cellular telephone works because the handsets are cheap and there is enough margin in the business to pay for the infrastructure or there's enough money in the parent business to subsidize the wireless. I'm not sure, I haven't done the analysis.

Cisco had a wireless product for last mile wireless that unfortunately, seems to have sunk without a trace. It was capable of delivering 40 Mbps per sector over a 3 kilometer radius cell. It cost approximately $100,000 per sector for the cell site equipment, another $50,000 to install, and $1000 for each customer's cpe equipment ($500 for the hardware, and $500 for the truck roll/site survey).

They estimated that each cell could handle approximately 1000 customers. Assuming that each cell was full (to closer approximate the cable model given earlier), the infrastructure costs is much lower (core infrastructure is $300 per customer) and the monthly costs are about $6000 per month higher because of tower costs.

At $40 per month, your revenue would be $40,000 versus a run rate of $86,000. With more cells, you can drop the per cell run rate because you can spread your people costs among multiple cells. You will need to spread them mighty thin because your fixed costs are about $36,000 per cell.

a more realistic analysis would put the cell population closer to 400 subscribers per cell which dropped your monthly revenue to 16,000 per month which doesn't even cover the cost of your T3.

now I'm not sure about the costs of 3g wireless equipment yet but it's probably going to be more expensive than what Cisco was selling. When you add into the mix the cost of spectrum fees and the low perceived value for mobile Internet access, it's a recipe for financial disaster.

I also don't believe that telephony services will help subsidize the data services because I don't think regulators will let wireless or fiber based services replace POTS for lifeline services. One good thing about copper based telephony is that the receiver can be passive and will continue to function even in a power outage. The same cannot be said about any telephony service requiring power for the CPE.

So to bring things back to the intersection of wired vs. wireless Internet service, the only way wireless companies can justify their infrastructure costs for high-speed wireless data services is through a mix of mobile and fixed point services. This means competing with cable companies and DSL for customers. High-speed wireless service is competitive with DSL because they can sustain comparable data rates. High-speed wireless services can also compete with today's cable services because both services deliver comparable data rates.

is high-speed wireless going to happen? Eventually but not as quickly as people think. My opinion is that it will take approximately 10 years before high-speed wireless service is deployed. The reason for that kind of delay is based on my estimate on how long it will take to pay off the current cellular infrastructure. I think a reasonable model for the deployment would be to look at Sprint's PCS deployment.

5124. Putting together a tracker

Newsgroup: rec.radio.amateur.digital.misc

I'm new to APRS and was able to get it running on my Kenwood TM-D700. What i'd like to do is put something together to bring with me in the car when I travel. The easiest tracker I think I could assemble would be one of the following.

Kenwood TM-D7A(G)
Garmin GPS III

or

some transceiver (not sure which one)
Kantronics KPS 3 Plus w/ GPS (assuming I can find one)

Could someone recommend a better or less expensive option? Thanks.

Tim

3g (UMTS) can only be a disaster, period. At least here in Europe.

Companies have paid ridiculous amounts of money for the spectrum usage.
In some countries the price was quite low, but because every telco over
here has acquired companies in other countries, they all have paid billions
of dollars one way or the other.

For example, in Germany the telcos have paid about one thousand dollars per
inhabitant of the country for their license. Of course they will not be
able to sell a subscription to each and every inhabitant.
No matter how you tweak it, they will have to re-coup several thousand
dollars per subscriber. Over a period of several years, of course, but
considering the rate of development it should not be more than 10 years
until the next generation comes along, more likely 5 years.

So, for the license alone they will have to re-coup much more money per
subscription than the current GSM subscriber ever spends. And then there is
the hardware, the sites, the personnel...

The price was driven up because the auctions took place in the "new economy
bubble" period that also saw skyrocketing share prices. After the collapse,
some telcos already got in financial trouble and had to layoff people.

When you are looking for .c code (and thus not dependent on the processor),
you can look at the Linux kernel. It has HDLC code for use with bit-banged
modems on the serial port ("Baycom") and DSP-based modems on the soundcard.

Visit www.tapr.org and have a look at the sample PIC Encoder
code. There is PIC assembly code that implements AX.25 UI
frames and HDLC in both directions.

I don't recall just how open it is, but it's there and well
worth a look.

It just takes time. Much of the information on the AMSAT-UK
web page is due to the work of one person who has taken the
time to gather the information and put it there.

Are you volunteering to do something similar with AMSAT-NA's
web page?

I ran mine to the "packet" connector. I think that's the 5 pin DIN. It works fine, but I have to run in the packet mode which is LSB only. That's not really a problem, but you do have to make some funny translations to determine the frequency. If you run a mode where the sideband selection is critical, then you'll have to invert your signal via software. I think most of the programs have that option. Psk31 doesn't need this however.

Jim.

I still can't imagine how you will maintain data-quality
transmissions when you are trying to receive a low-power
station a mile away, and the kids next door are talking
on top of you.

It seems this will be the practical limitation, so few
channels and a buttload of "VHF-CB" users.

Martin

Of course the great thing about the WWW is that you can have a hyperlink
that provides single-click access to information you are not prepared
to provide yourself, but is provided by other people.

But there is no such link in immediate view on the AMSAT-NA p3d pages.
This of course means that many US hams never know that other AMSAT
organisations provide more uptodate news reports.

5141. Req NAVTEX on KAM info, ideas

Newsgroup: rec.radio.amateur.digital.misc

Hi Folks,

Thanks for reading this and a happy new millenium to you!

I have a Kantronics KAM w/Enhancement Board, firmware Ver 6.1
I've read the bit in it's manual about NAVTEX and am already somewhat familiar with the service. I'm on the coast :{D and I've found what appears to be a regional NAVTEX beacon site on 518 kHz with my little Sony 7600. However not sure if NAVTEX is 518 kHz reference, mark or what, nor which mode I should have the radio in, ie LSB/USB. I've used HF packet quite a bit and done a lot of RTTY/SITOR/AMTOR monitoring in the past so familiar with reversed signals, shift and rate parameters. I'd like to get the Kenwood TS-440SAT on to this project and improve the antenna situation when possible.

In the 1999 Canadian Coast Guard publication Radio Aids to Marine Navigation NAVTEX is listed as F1B/radioteletype and only two stns are listed, Prince Rupert ID 'D' and Tofino ID 'H' which is one I'd be more likely to receive. What I do pick up is 'CL' in cw. Is it American? A look through my old FAA Location Identifiers pub and Grove's Shortwave Directory don't reveal anything on CL. Neither does my '96 edition of the Canada Flight Supplement.

Any ideas on how to improve my chances or ID what I have found would be appreciated. Even talking with a local Cdn Coast Guard telecom tech didn't help.

Thanks for your time es 73, JD VA7JD

Are you really worried about someone stealing or messing with you QSL cards?
Try a password software program to remember them for you.

Use a simple password like "me"!

Its easier than addressing and sticking a stamp on an envelope, and you can
do your whole log in a minute or two. In the time you took to answer that
post you could have QSLed everyone in your whole logbook!

If you think its too hard, I doubt you QSL by any method unless its for
yourself. I do it for all the people who want the confirmations!

518 khz is center frequency
ids are one letter. "C" is San Francisco.
Complete list at: http://www.iprimus.ca/~hepburnw/dx/navtex.htm

As an active station I try to QSL 100% but it gets more expensive every day, especially for DX. In this age of international Internet usage this sounds like a good idea. As I have been working on a Digital mode DXCC the last year and half. However, will these be accepted by the various awards committees for credit?

I think it is at least worth a look at even for one more password.

Macnet is the WW group of Ham Radio Operators that use Mac computers
to e x t e n d their communications capabilities.

We stay in touch with each other via Radio, Internet, Telephone, and
actual visits.

o Amateur Radio CALL SIGN
o FULL NAME
o Street ADDRESS
o CITY, STATE, ZIP
o EMAIL ADDRESS

To join Macnet, send YOUR STATS to mailto:wd1v@amsat.org and access

* Macnet Member Listing - as the name implies, its "The List" of all of
the hams in the world that are using Macs with their radios. In ZIP CODE
order so you can see your neighbors and get together easily.
http://wdonev.ne.mediaone.net/homepage/Macnet2001.html

* Macnet Ham Radio Software Listing - "The List" of the latest - much of
it with FTP links so what you see is what you can get with just a click.
http://wdonev.ne.mediaone.net/homepage/Page7.html

* Macnet Software Collections
ftp://ftp.qsl.net/pub/wd1v/
http://www.qrz.com/download/mac/index.html

* Get the COMPLETE Macnet Software Collection
ppd. on (2) 100 MB Zip Disks for $30.00 ($40.00 DX)
(costs are for media, postage, & handling)
check or money order to:

Also check out http://www.tapr.org. They have a Micro PIC-E product
intended for APRS applications. The code is open sourece and contains
HDLC routines.

How about a couple of IDC connectors with an inch or 2 of ribbon cable between them. You could make that go in any direction is it was a few inches long.

I have an old back shell (for 25 pin) here that has the cable coming out at a right angle, so they do (or did) exist.

I reckon, with the aid of a stanly knife, some duct tape and a bit of butchering, I could turn a 9 pin D into a low profile right angle connector. And toss the long knurled screws and use the shorter screwdriver jobs.

Have fun.

5149. The state of ham radio networking.

Newsgroup: rec.radio.amateur.digital.misc
Date: 2000-12-31 21:32:31 UTC
From: Hank Oredson <horedson@att.net>
Message-ID: <PBN36.8206$al6.555038@bgtnsc05-news.ops.worldnet.att.net>
Source record: 9736

A couple folks asked that I repost my specific suggestions
on how to migrate the existing BBS network to the model in
current use on the internet. Here they are again. Not well
organized, a bit of babble, but specific ideas. Would they
work in practice? I've implemented some of these ideas in
SNOS, and they appear to work fine.

Each BBS network message type has an equivalent internet
application and protocol. For the BBS network to interoperate
with these applications and protocols we need some number
of "gateway" systems which do the appropriate translations.

1) Bulletins map to net news and the nntp protocol.
We need a set of newsgroups defined to map to/from the common
BBS network topics. One solution would be to use newsgroups
of the form alt.<distribution>.<topic> where <topic> is the To:
field of the BBS message and <distribution> is the @ BBS field.
Thus we would have, for example, alt.amsat.keps, alt.ww.sysop,
alt.usa.all, etc. The gateway servers would move messages both
directions using the obvious and simple mapping.

2) Personal messages map to standard email and the pop3/smtp
protocols. We can use the obvious address mapping. I've run
this kind of gateway server for years, initially using a version
of JNOS and recently using SNOS. It works fine.

3) NTS messages are an intersting case. They probably need to map
to net news and the nntp protocol. We might use a newsgroup
such as alt.usa.nts-traffic for this purpose. In this case the
same gateway servers which handle 1) will suffice.
Ideas welcome from the NTS folks on how we might handle this.

Note that we do not need "permission" from NIS or anyone else to
begin to implement this capability. Everything exists within the
ham radio network and not within the internet per se. The model
is designed to be compatible with internet standards for the obvious
reason: those standards exist and are well tested. We should use them.

For some of the standards, file transfer protocols also exist. For
example email has pop3 and smtp as network data transfer standards,
and RFC-822 (and it's various updates) provide a guide to the
construction of a bulk transfer protocol. We already use this protocol
as import/export between BBS systems of various kinds. The needed
extensions to the standard set of headers are documented in the
BBS specification. For net news two standard transports exist. One is
a bulk file transport using the "ihave/iwant" scheme similar to

what is called "X forwarding" in the BBS network. The needed mappings are obvious and should be simple to implement.

All the above would require only a small amount of fairly simple programming effort on the part of the authors of the ham radio tcp/ip programs, and very little effort on the part of the authors of the ham radio BBS programs. The hard work is deciding on the details of how the mappings will work, and setting up enough gateway servers to attract users.

One advantage of this scheme is that we could use it to link existing news groups in the internet directly to the ham radio BBS network, with bidirectional exchange of messages. Some might consider this a disadvantage because of the obvious possibility of abuse by both hams and non-hams. This possibility should not get in the way of creating and testing the technology.

There is an interesting technique we could use to do this integration. If each "gateway" server ran a web server with a standard middleware API to a local database, then the task of programming the needed applications would be fairly simple. What applications are needed? Those required for the administration of the "gateway" server itself, for example, to maintain mappings, deal with exceptions, and all the other "sysop" type of activities.

One could even consider creating a "regular ham radio BBS" using the capabilities of the web server. This has in fact been done, several times, by various hams. Perhaps those hams might consider making their work available to others in the ham radio network as well as on the internet. Doing so might help move the digital networking facet of our hobby forward. i.e. "The folks using html on ham radio are headed in the right direction."

Disclaimer: Yes, I know the above sounds a lot like the integration of ham radio networking with the internet. That is exactly what it is. I hope everyone can understand the difference between taking ideas and techniques from the internet for use in ham radio, and replacing ham radio with the internet itself. I propose the former, and not the later.
